u-blox ZED-F9P

Interface Description

Abstract

The Interface Description describes the UBX (version 27.11), NMEA and RTCM protocols and serves as a reference manual for the u-blox ZED-F9P high precision positioning receiver.

Preface

1 Document Overview

The Interface Description is a reference describing the messages used by the u-blox receiver and is organized by the specific NMEA, UBX, and RTCM messages.

2 Firmware and Protocol Versions

The protocol version defines a set of messages that are applicable across various u-blox products. Each firmware used by a u-blox receiver supports a specific protocol version, which is not configurable.

The following sections will explain how to decode the shown information to get the firmware and the protocol version.

2.1 How to Determine the Version and the Location of the Firmware

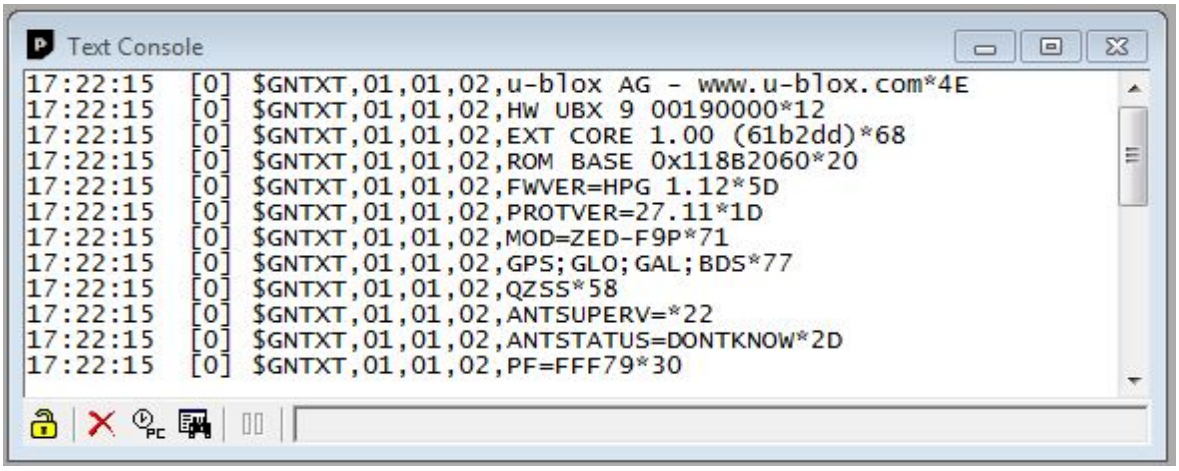
The u-blox receiver contains a firmware in two different locations:

- Internal ROM
- External Flash memory

The location and the version of the currently running firmware can be found in the boot screen or in the UBX-MON-VER message.

2.1.1 Decoding the Boot Screen (for Protocol Version 24 and Above)

Boot screen for a u-blox receiver running from Flash:



Possible lines in the boot screen and their meanings:

Entry	Description
`u-blox AG - www.u-blox.com`	Start of the boot screen
`HW UBX 9 00190000`	Hardware version of the u-blox receiver (u-blox 9 receiver)
`EXT CORE 1.00 (61b2dd)`	Firmware version 1.00 downloaded from **Flash** (revision number)
`ROM BASE`	Underlying firmware version in **ROM** (revision number)

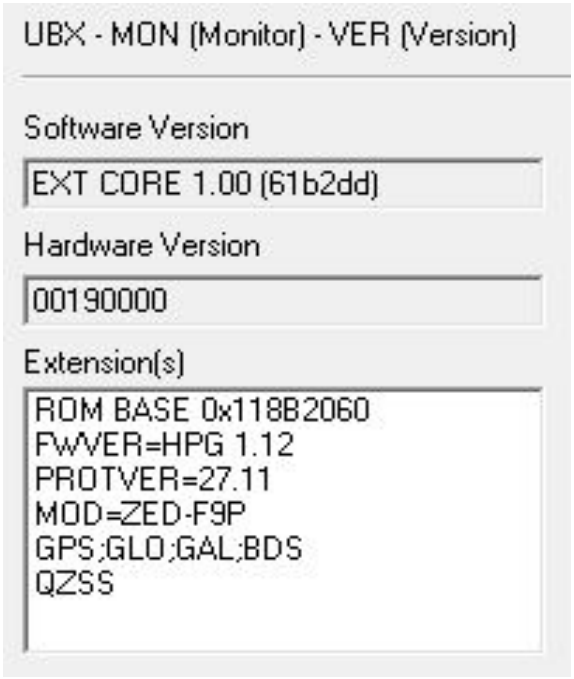
Possible lines in the boot screen and their meanings: continued

Entry	Description
FWVER=HPG 1.12	Firmware of product category and version where SPG: Firmware of Standard Precision GNSS product HPG: Firmware of High Precision GNSS product ADR: Firmware of ADR product UDR: Firmware of UDR product TIM: Firmware of Time Sync product FTS: Firmware of Time & Frequency Sync product LAP: Firmware of Lane Accurate product
PROTVER=27.11	Supported protocol version
GPS;GLO;GAL;BDS	Supported major GNSS.
SBAS;IMES;QZSS	Supported augmentation systems.
ANTSUPERV=AC SD PDoS SR	Configuration of the Antenna supervisor where AC: Active Antenna Control enabled SD: Short Circuit Detection enabled OD: Open Circuit Detection enabled PDoS: Short Circuit Power Down Logic enabled SR: Automatic Recovery from Short state
PF=FFF79	Product configuration.

The line containing the FWVER indicates which version of the firmware is currently running and is called **firmware version** in the rest of the document.

The numbers in parentheses (revision numbers) should only be used to identify a known firmware version and are not guaranteed to increase over time.

2.1.2 Decoding the output of UBX-MON-VER (for Protocol Version 24 and above)



Possible fields in UBX-MON-VER and their meanings:

Entry	Description
Software Version `EXT CORE 1.00 (61b2dd)`	Currently running firmware version. If `ROM CORE`, then the u-blox receiver runs from **ROM**. If `EXT CORE`, then the u-blox receiver runs a firmware downloaded from **Flash**.
Hardware Version	The hardware version of the u-blox receiver.
Extension(s)	Extended information about the u-blox receiver firmware. See table below for the entries.

☞ Not every entry is output by every u-blox receiver in the UBX-MON-VER extensions. This depends on the product, the firmware location and the firmware version.

Possible entries in UBX-MON-VER Extension(s):

Entry	Description
`ROM BASE`	Underlying firmware version in ROM. If such an entry is present, then the u-blox receiver runs a firmware downloaded from **Flash**.
`FWVER=HPG 1.12`	Firmware of product category and version where `SPG`: Firmware of Standard Precision GNSS product `HPG`: Firmware of High Precision GNSS product `ADR`: Firmware of ADR product `UDR`: Firmware of UDR product `TIM`: Firmware of Time Sync product `FTS`: Firmware of Time & Frequency Sync product `LAP`: Firmware of Lane Accurate product
`PROTVER=27.11`	Supported protocol version.
`MOD=ZED-F9P`	Module identification. Set in production.
`GPS;GLO;GAL;BDS`	Supported major GNSS.
`SBAS;IMES;QZSS`	Supported augmentation systems.

2.2 How to Determine the Supported Protocol Version of the u-blox Receiver

Each u-blox receiver reports its supported protocol version in the following ways:

- On start-up in the boot screen
- In the `UBX-MON-VER message`

with the line containing PROTVER (example: `PROTVER=27.11`).

Additionally, the firmware string, together with the firmware version, can be used to look up the corresponding protocol version. The tables below give an overview of the released firmware and their corresponding protocol versions.

2.2.1 u-blox 9 Firmware and Supported Protocol Versions

Firmware for High Precision GNSS Products

Firmware version	Firmware string	Protocol Version
HPG 1.00	EXT CORE 1.00 (61ce84)	27.00
HPG 1.10	EXT CORE 1.00 (eba0dc)	27.10
HPG 1.11	EXT CORE 1.00 (94e56e)	27.10

Firmware for High Precision GNSS Products continued

Firmware version	Firmware string	Protocol Version
HPG 1.12	EXT CORE 1.00 (61b2dd)	27.11

3 Receiver Configuration

u-blox positioning receivers are fully configurable with UBX protocol messages. The configuration used by the receiver during normal operation is called the "current configuration". The current configuration can be changed during normal operation by sending UBX-CFG-VALSET messages over any I/O port (except UART2). The receiver will change its current configuration immediately after receiving a configuration message. The receiver will always use the current configuration only.

The current configuration is loaded from permanent configuration hard-coded in the receiver firmware (the defaults) and from non-volatile memory (user configuration) on startup of the receiver. Changes made to the current configuration at run-time will be lost when there is a power cycle, a hardware reset or a (complete) controlled software reset (see chapter Forcing a Receiver Reset in the Integration Manual).

See the Configuration Interface section for a detailed description of the receiver configuration system, the explanation of the configuration concept and its principles and interfaces.

The configuration interface has changed from earlier u-blox positioning receivers. There is some backwards compatibility. Users are strongly advised to only use the Configuration Interface referred to in the following sections. See also Legacy Configuration Interface Compatibility.

See the Integration Manual for a basic receiver configuration most commonly used.

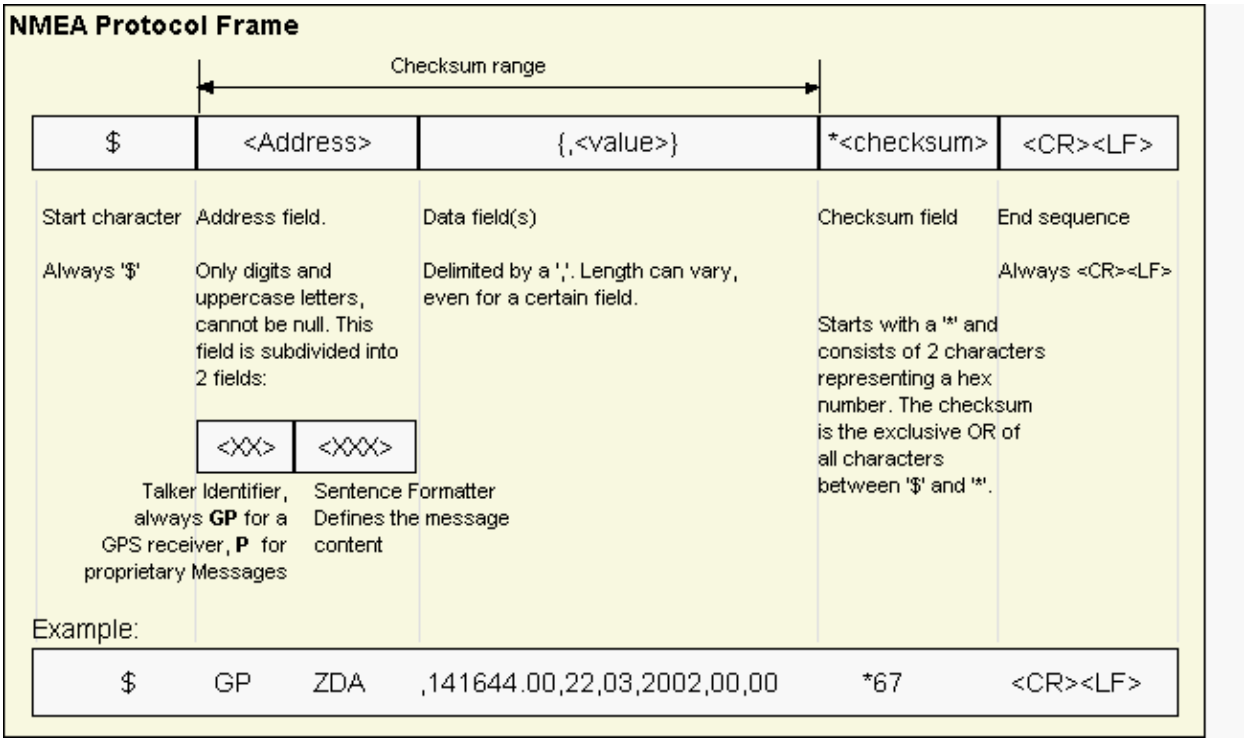
Interface Description

4 NMEA Protocol

4.1 Protocol Overview

4.1.1 Message Format

NMEA messages sent by the GNSS receiver are based on NMEA 0183 Version 4.10. The following picture shows the structure of a NMEA protocol message.



For further information on the NMEA Standard, refer to NMEA 0183 Standard For Interfacing Marine Electronic Devices, Version 4.10, June, 2012. See http://www.nmea.org/ for ordering instructions.

The NMEA standard allows for proprietary, manufacturer-specific messages to be added. These shall be marked with a manufacturer mnemonic. The mnemonic assigned to u-blox is UBX and is used for all non-standard messages. These proprietary NMEA messages therefore have the address field set to PUBX. The first data field in a PUBX message identifies the message number with two digits.

4.1.2 Talker ID

One of the ways the NMEA standard differentiates between GNSS is by using a two-letter message identifier, the 'Talker ID'. The specific Talker ID used by a u-blox receiver will depend on the device model and system configuration. The table below shows the Talker ID that will be used for various GNSS configurations.

NMEA Talker IDs

Configured GNSS	Talker ID
GPS, SBAS, QZSS	GP
GLONASS	GL
Galileo	GA
BeiDou	GB*
Any combination of GNSS	GN

*This is a u-blox extension to the NMEA 4.10 standard. Only NMEA 4.11 defines the GB talker ID. See also Extended Configuration in Protocol Configuration.

4.1.3 Protocol Configuration

The NMEA protocol on u-blox receivers can be configured to the need of customer applications using configuration items CFG-NMEA-*.

There are four NMEA standards supported. The default NMEA version is 4.10. Alternatively versions 4.00, 2.3, and 2.1 can be enabled (for details on how this affects the output refer to section Position Fix Flags in NMEA Mode).

NMEA defines satellite numbering systems for some, but not all GNSS (this is partly dependent on the NMEA version). Satellite numbers for unsupported GNSS can be configured using configuration items CFG-NMEA-*. Unknown satellite numbers are always reported as a null NMEA field (i.e. an empty string).

The NMEA specification indicates that the GGA message is GPS specific. However, u-blox receivers support the output of a GGA message for each of the Talker IDs.

NMEA filtering flags

Parameter	Description
Position filtering	Enable positions from failed or invalid fixes to be reported (with the "V" status flag to indicate that the data is not valid).
Valid position filtering	Enable positions from invalid fixes to be reported (with the "V" status flag to indicate that the data is not valid).
Time filtering	Enable the receiver's best knowledge of time to be output, even though it might be wrong.
Date filtering	Enable the receiver's best knowledge of date to be output, even though it might be wrong.
GPS-only filtering	Restrict output to GPS satellites only.
Track filtering	Permit course over ground (COG) to be reported even when it would otherwise be frozen.

NMEA flags

Parameter	Description
Compatibility Mode	Some older NMEA applications expect the NMEA output to be formatted in a specific way, for example, they will only work if the latitude and longitude have exactly four digits behind the decimal point. u-blox receivers offer a compatibility mode to support these legacy applications.

NMEA flags continued

Parameter	Description
Consideration Mode	u-blox receivers use a sophisticated signal quality detection scheme, in order to produce the best possible position output. This algorithm considers all SV measurements, and may eventually decide to only use a subset thereof, if it improves the overall position accuracy. If Consideration mode is enabled, all satellites, which were considered for navigation, are communicated as being used for the position determination. If Consideration Mode is disabled, only those satellites which after the consideration step remained in the position output are marked as being used.
Limit82 Mode	Enabling this mode will limit the NMEA sentence length to a maximum of 82 characters.
High Precision Mode	Enabling this mode increases precision of the position output. Latitude and longitude then have seven digits after the decimal point, and altitude has three digits after the decimal point. Note: The High Precision Mode cannot be set in conjunction with either Compatibility Mode or Limit82 Mode.

Extended configuration

Option	Description
GNSS to filter	Filters satellites based on their GNSS
Satellite numbering	This field configures the display of satellites that do not have an NMEA-defined value. Note: this does not apply to satellites with an unknown ID.
Main Talker ID	By default the main Talker ID (i.e. the Talker ID used for all messages other than GSV) is determined by the GNSS assignment of the receiver's channels (see configuration items CFG-SIGNAL-*). This field enables the main Talker ID to be overridden.
GSV Talker ID	By default the Talker ID for GSV messages is GNSS specific (as defined by NMEA). This field enables the GSV Talker ID to be overridden.
BDS Talker ID	By default the Talker ID for BeiDou is 'GB'. This field enables the BeiDou Talker ID to be overridden.

Extra fields in NMEA 4.10 and above

Message	Extra fields
GBS	systemId, signalId
GNS	navStatus
GRS	systemId, signalId
GSA	systemId
GSV	signalId
RMC	navStatus

4.1.4 Satellite Numbering

The NMEA protocol (V4.10) identifies GNSS satellites with a one digit system ID and a two digit satellite number. u-blox receivers support this method in their NMEA output when "strict" SV numbering is selected.

In most cases this is the default setting, but can be checked or set using configuration items CFG-NMEA-*.

In order to support QZSS within current receivers and prepare for support of other systems (e.g.

Galileo) in future receivers, an "extended" SV numbering scheme can be enabled (using configuration items CFG-NMEA-*).

This uses the NMEA-defined numbers where possible, but adds other number ranges to support other GNSS. Note however that these non-standard extensions require 3 digit numbers, which may not be supported by some NMEA parsing software. For example QZSS satellites are reported using numbers in the range 193 to 197.

See Satellite Numbering for a complete list of satellite numbers.

☞ GLONASS satellites can be tracked before they have been identified. In NMEA output, such unknown satellite numbers are always reported as a null field (i.e. an empty string).

4.1.5 Latitude and Longitude Format

According to the NMEA Standard, Latitude and Longitude are output in the format Degrees, Minutes and (Decimal) Fractions of Minutes. To convert to Degrees and Fractions of Degrees, or Degrees, Minutes, Seconds and Fractions of seconds, the 'Minutes' and 'Fractional Minutes' parts need to be converted. In other words: If the GPS Receiver reports a Latitude of 4717.112671 North and Longitude of 00833.914843 East, this is

Latitude 47 Degrees, 17.112671 Minutes

Longitude 8 Degrees, 33.914843 Minutes

or

Latitude 47 Degrees, 17 Minutes, 6.76026 Seconds

Longitude 8 Degrees, 33 Minutes, 54.89058 Seconds

or

Latitude 47.28521118 Degrees

Longitude 8.56524738 Degrees

4.1.6 Position Fix Flags

This section shows how u-blox implements the NMEA protocol and the conditions determining how flags are set.

Flags in NMEA 4.10 and above

NMEA Message Field	GLL, RMC status	GGA quality	GLL, VTG posMode	RMC, GNS posMode
No position fix (at power-up, after losing satellite lock)	V	0	N	N
GNSS fix, but user limits exceeded	V	0	N	N
Dead reckoning fix, but user limits exceeded	V	6	E	E
Dead reckoning fix	A	6	E	E
RTK float	A	5	D	F
RTK fixed	A	4	D	R
2D GNSS fix	A	1/2	A/D	A/D
3D GNSS fix	A	1/2	A/D	A/D
Combined GNSS/dead reckoning fix	A	1/2	A/D	A/D
	See below (1)	See below (2)	See below (3)	See below (3)

(1) Possible values for status: V = Data invalid, A = Data valid

(2) Possible values for quality: 0 = No fix, 1 = Autonomous GNSS fix, 2 = Differential GNSS fix, 4 =

RTK fixed, 5 = RTK float, 6 = Estimated/Dead reckoning fix

(3) Possible values for posMode: N = No fix, E = Estimated/Dead reckoning fix, A = Autonomous GNSS fix, D = Differential GNSS fix, F = RTK float, R = RTK fixed

Flags in NMEA 2.3 and above

NMEA Message Field	GLL, RMC status	GGA quality	GSA navMode	GLL, VTG, RMC, GNS posMode
No position fix (at power-up, after losing satellite lock)	V	0	1	N
GNSS fix, but user limits exceeded	V	0	1	N
Dead reckoning fix, but user limits exceeded	V	6	2	E
Dead reckoning fix	A	6	2	E
2D GNSS fix	A	1 / 2	2	A / D
3D GNSS fix	A	1 / 2	3	A / D
Combined GNSS/dead reckoning fix	A	1 / 2	3	A / D
	See below (1)	See below (2)	See below (3)	See below (4)

(1) Possible values for status: V = Data invalid, A = Data valid

(2) Possible values for quality: 0 = No fix, 1 = Autonomous GNSS fix, 2 = Differential GNSS fix, 4 = RTK fixed, 5 = RTK float, 6 = Estimated/Dead reckoning fix

(3) Possible values for navMode: 1 = No fix, 2 = 2D fix, 3 = 3D fix

(4) Possible values for posMode: N = No fix, E = Estimated/Dead reckoning fix, A = Autonomous GNSS fix, D = Differential GNSS fix, F = RTK float, R = RTK fixed

Flags in NMEA 2.1 and below

The flags in NMEA 2.1 and below are the same as NMEA 2.3 and above but with the following differences:

- The posMode field is not output for GLL, RMC and VTG messages (each message has one field less).
- The GGA quality field is set to 1 (instead of 6) for both types of dead reckoning fix.

4.1.7 Multi-GNSS Considerations

Many applications which process NMEA messages assume that only a single GNSS is active. However, when multiple GNSS are configured, the NMEA specification requires the output to change in the following ways:

NMEA output for Multi-GNSS

Change	Description
Main Talker ID	The main Talker ID will be 'GN' (e.g. instead of 'GP' for a GPS receiver)
GSV Talker IDs	The GSV message reports the signal strength of the visible satellites. However, the Talker ID it uses is specific to the GNSS it is reporting information for, so for a multi-GNSS receiver it will not be the same as the main Talker ID. (e.g. other messages will be using the 'GN' Talker ID but the GSV message will use GNSS-specific Talker IDs)

NMEA output for Multi-GNSS continued

Change	Description
Multiple GSA and GRS Messages	Multiple GSA and GRS messages are output for each fix, one for each GNSS. This may confuse applications which assume they are output only once per position fix (as is the case for a single GNSS receiver).

4.1.8 Output of Invalid/Unknown Data

By default the receiver will not output invalid data. In such cases, it will output empty fields.

A valid position fix is reported as follows:

```
$GPGLL,4717.11634,N,00833.91297,E,124923.00,A,A*6E
```

An invalid position fix (but time valid) is reported as follows:

```
$GPGLL,,,,,124924.00,V,N*42
```

If Time is unknown (e.g. during a cold-start):

```
$GPGLL,,,,,,V,N*64
```

Note:

Output of invalid data marked with the 'Invalid/Valid' Flags can be enabled using the configuration items CFG-NMEA-*.

4.1.9 Messages Overview

When configuring NMEA messages using the configuration items CFG-NMEA-*), the Class/Ids shown in the table shall be used.

4.2 Standard Messages

Standard Messages: i.e. Messages as defined in the NMEA Standard.

4.2.1 DTM

4.2.1.1 Datum Reference

Message	**DTM**		
Description	**Datum Reference**		
Firmware	Supported on: • u-blox 9 with protocol version 27.11		
Type	Output		
Comment	This message gives the difference between the current datum and the reference datum. The current datum defaults to WGS84. The reference datum cannot be changed and is always set to WGS84.		
Message Info	ID for CFG-MSG	Number of fields	
	0xF0 0x0A	11	

Message Structure:

Example:

```
$GPDTM,W84,,0.0,N,0.0,E,0.0,W84*6F
$GPDTM,999,,0.08,N,0.07,E,-47.7,W84*1C
```

Field No.	Name	Unit	Format	Example	Description
0	xxDTM	-	string	$GPDTM	DTM Message ID (xx = current Talker ID, see NMEA Talker IDs table)
1	datum	-	string	W84	Local datum code: W84 = WGS84, P90 = PZ90, 999 = user defined
2	subDatum	-	string	-	A null field
3	lat	min	numeric	0.08	Offset in Latitude
4	NS	-	character	S	North/South indicator
5	lon	min	numeric	0.07	Offset in Longitude
6	EW	-	character	E	East/West indicator
7	alt	m	numeric	-2.8	Offset in altitude
8	refDatum	-	string	W84	Reference datum code: W84 (WGS 84, fixed field)

4.2.2 GAQ

4.2.2.1 Poll a standard message (if the current Talker ID is GA)

Message	**GAQ**		
Description	**Poll a standard message (if the current Talker ID is GA)**		
Firmware	Supported on: • u-blox 9 with protocol version 27.11		
Type	Poll Request		
Comment	Polls a standard NMEA message if the current Talker ID is GA		
Message Info	ID for CFG-MSG	Number of fields	
	0xF0 0x45	4	

Message Structure:

1	msgId	-	string	RMC	Message ID of the message to be polled
2	cs	-	hexadecimal	*2B	Checksum
3	<CR><LF>	-	character	-	Carriage return and line feed

4.2.3 GBQ

4.2.3.1 Poll a standard message (if the current Talker ID is GB)

Message	**GBQ**		
Description	**Poll a standard message (if the current Talker ID is GB)**		
Firmware	Supported on: • u-blox 9 with protocol version 27.11		
Type	Poll Request		
Comment	Polls a standard NMEA message if the current Talker ID is GB		
Message Info	ID for CFG-MSG	Number of fields	
	0xF0 0x44	4	

Message Structure:

```

Field No.	Name	Unit	Format	Example	Description
0	xxGBQ	-	string	$EIGBQ	GBQ Message ID (xx = Talker ID of the device requesting the poll)
1	msgId	-	string	RMC	Message ID of the message to be polled
2	cs	-	hexadecimal	*28	Checksum
3	<CR><LF>	-	character	-	Carriage return and line feed

4.2.4 GBS

4.2.4.1 GNSS Satellite Fault Detection

Message	**GBS**		
Description	**GNSS Satellite Fault Detection**		
Firmware	Supported on: • u-blox 9 with protocol version 27.11		
Type	Output		
Comment	This message outputs the results of the Receiver Autonomous Integrity Monitoring Algorithm (RAIM). • The fields **errLat**, **errLon** and **errAlt** output the standard deviation of the position calculation, using all satellites which pass the RAIM test successfully. • The fields **errLat**, **errLon** and **errAlt** are only output if the RAIM process passed successfully (i.e. no or successful edits happened). These fields are never output if 4 or fewer satellites are used for the navigation calculation (because, in such cases, integrity can not be determined by the receiver autonomously). • The fields **prob**, **bias** and **stdev** are only output if at least one satellite failed in the RAIM test. If more than one satellites fail the RAIM test, only the information for the worst satellite is output in this message.

4.2.5 GGA

4.2.5.1 Global positioning system fix data

Message	**GGA**		
Description	**Global positioning system fix data**		
Firmware	Supported on: • u-blox 9 with protocol version 27.11		
Type	Output		
Comment	**The output of this message is dependent on the currently selected datum (default: WGS84). The NMEA specification indicates that the GGA message is GPS specific. However, when the receiver is configured for multi-GNSS, the GGA message contents will be generated from the multi-GNSS solution. For multi-GNSS use, it is recommended that the NMEA-GNS message is used instead.** Time and position, together with GPS fixing related data (number of satellites in use, and the resulting HDOP, age of differential data if in use, etc.).

5 UBX Protocol

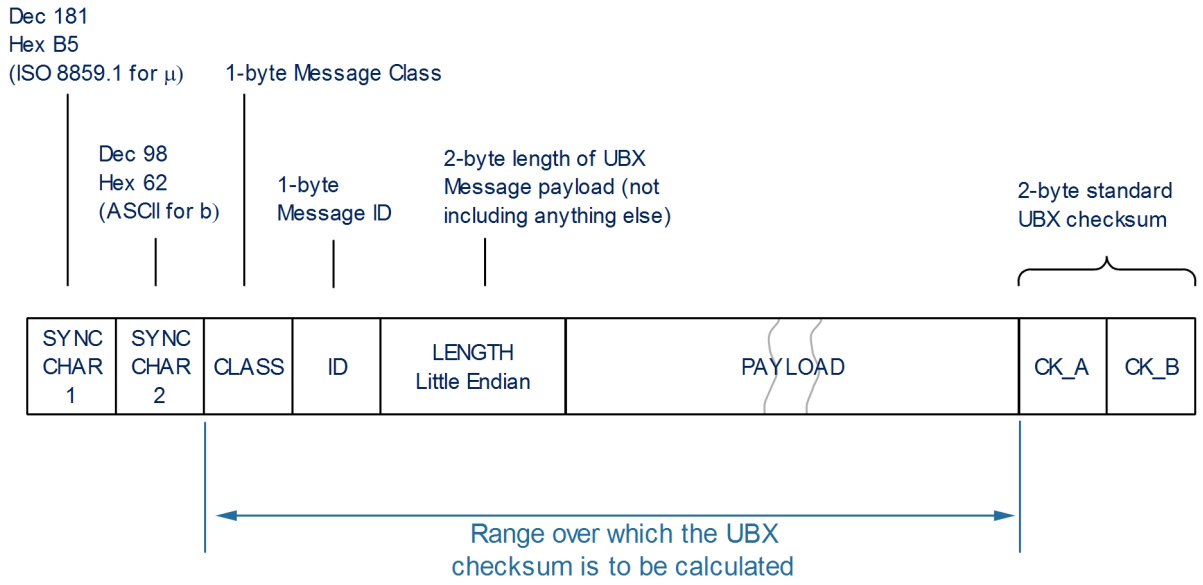
5.1 UBX Protocol Key Features

u-blox receivers support a u-blox proprietary protocol to communicate with a host computer. This protocol has the following key features:

- Compact - uses 8-bit Binary Data.
- Checksum Protected - uses a low-overhead checksum algorithm
- Modular - uses a 2-stage message identifier (Class and Message ID)

5.2 UBX Frame Structure

The structure of a basic UBX Frame is shown in the following diagram.



- Every **Frame** starts with a 2-byte Preamble consisting of two synchronization characters: 0xB5 0x62.
- A 1-byte Message **Class** field follows. A Class is a group of messages that are related to each other.
- A 1-byte Message **ID** field defines the message that is to follow.
- A 2-byte **Length** field follows. The length is defined as being that of the payload only. It does not include the Preamble, Message Class, Message ID, Length, or CRC fields. The number format of the length field is a Little-Endian unsigned 16-bit integer.
- The **Payload** field contains a variable number of bytes.
- The two 1-byte **CK_A** and **CK_B** fields hold a 16-bit checksum whose calculation is defined below. This concludes the Frame.

5.3 UBX Payload Definition Rules

5.3.1 Structure Packing

Values are placed in an order that structure packing is not a problem. This means that 2-byte values shall start on offsets which are a multiple of 2; 4-byte values shall start at a multiple of 4; and so on.

5.3.2 Reserved Elements

Some messages contain reserved fields or bits to allow for future expansion. The contents of these elements should be ignored in output messages and must be set to zero in input messages. Where a message is output and subsequently returned to the receiver as input message, reserved elements can either be explicitly set to zero or left with whatever value they were output with.

5.3.3 Undefined Values

The description of some fields provide specific meanings for specific values. For example, the field gnssId appears in many UBX messages and uses 0 to indicate GPS, 1 for SBAS and so on (see Satellite Numbering for details); however it is usually stored in a byte with far more possible values than the handful currently defined. All such undefined values are reserved for future expansion and therefore should not be used.

5.3.4 Message Naming

Referring to messages is done by adding the class name and a dash in front of the message name. For example, the version information message is referred to as `UBX-MON-VER`. Referring to message fields or their values is done by adding a dot and the name, e.g. `UBX-MON-VER.swVersion`.

5.3.5 Number Formats

All multi-byte values are ordered in Little Endian format, unless otherwise indicated.

All floating point values are transmitted in IEEE754 single or double precision.

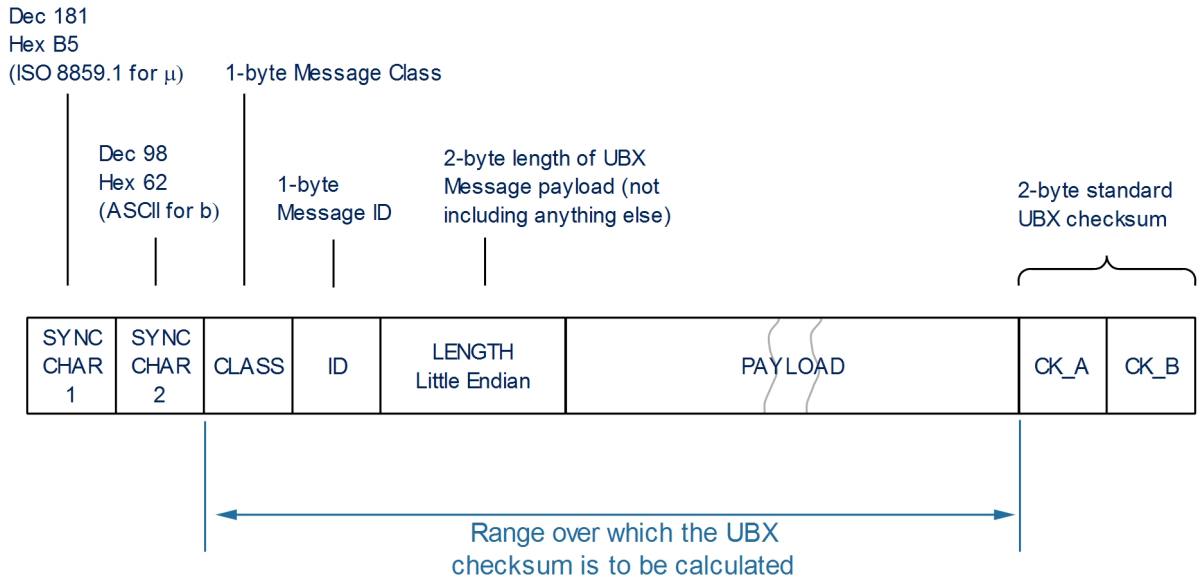
5.4 UBX Checksum

The checksum is calculated over the Message, starting and including the CLASS field, up until, but excluding, the Checksum Field:



The checksum algorithm used is the 8-Bit Fletcher Algorithm, which is used in the TCP standard (RFC 1145). This algorithm works as follows:

- Buffer[N] contains the data over which the checksum is to be calculated.
- The two CK_ values are 8-Bit unsigned integers, only! If implementing with larger-sized integer values, make sure to mask both CK_A and CK_B with 0xFF after both operations in the loop.

```
CK_A = 0, CK_B = 0
For(I=0;I<N;I++)
{
    CK_A = CK_A + Buffer[I]
    CK_B = CK_B + CK_A
}
```

- After the loop, the two U1 values contain the checksum, transmitted after the Message, which conclude the Frame.

5.5 UBX Message Flow

There are certain features associated with the messages being sent back and forth:

5.5.1 Acknowledgement

When messages from the class CFG are sent to the receiver, the receiver will send an "acknowledge" (UBX-ACK-ACK) or a "not acknowledge" (UBX-ACK-NAK) message back to the sender, depending on whether or not the message was processed correctly.

Some messages from other classes (e.g. LOG) also use the same acknowledgement mechanism.

5.5.2 Polling Mechanism

All messages that are output by the receiver in a periodic manner (i.e. messages in classes MON, NAV and RXM) and Get/Set type messages, such as the messages in the CFG class, can also be polled.

The UBX protocol is designed so that messages can be polled by sending the message required to the receiver but without a payload (or with just a single parameter that identifies the poll request). The receiver then responds with the same message with the payload populated.

5.6 UBX Class IDs

A class is a grouping of messages which are related to each other. The following table lists all the current message classes.

Name	Class	Description
NAV	0x01	Navigation Results Messages: Position, Speed, Time, Acceleration, Heading, DOP, SVs used
RXM	0x02	Receiver Manager Messages: Satellite Status, RTC Status
INF	0x04	Information Messages: Printf-Style Messages, with IDs such as Error, Warning, Notice
ACK	0x05	Ack/Nak Messages: Acknowledge or Reject messages to UBX-CFG input messages
CFG	0x06	Configuration Input Messages: Configure the receiver.
UPD	0x09	Firmware Update Messages: Memory/Flash erase/write, Reboot, Flash identification, etc.
MON	0x0A	Monitoring Messages: Communication Status, CPU Load, Stack Usage, Task Status
TIM	0x0D	Timing Messages: Time Pulse Output, Time Mark Results
MGA	0x13	Multiple GNSS Assistance Messages: Assistance data for various GNSS
LOG	0x21	Logging Messages: Log creation, deletion, info and retrieval
SEC	0x27	Security Feature Messages

All remaining class IDs are reserved.

5.8 UBX-ACK (0x05)

Ack/Nak Messages: i.e. Acknowledge or Reject messages to UBX-CFG input messages. Messages in the UBX-ACK class output the processing results to UBX-CFG and some other messages.

5.8.1 UBX-ACK-ACK (0x05 0x01)

5.8.1.1 Message Acknowledged

Message	**UBX-ACK-ACK**					
Description	**Message Acknowledged**					
Firmware	Supported on: • u-blox 9 with protocol version 27.11					
Type	Output					
Comment	Output upon processing of an input message. ACK Message is sent as soon as possible but at least within one second.					
Message Structure	Header	Class	ID	Length (Bytes)	Payload	Checksum
	0xB5 0x62	0x05	0x01	2	see below	CK_A CK_B

Payload Contents:

Byte Offset	Number Format	Scaling	Name	Unit	Description
0	U1	-	`clsID`	-	Class ID of the Acknowledged Message
1	U1	-	`msgID`	-	Message ID of the Acknowledged Message

5.8.2 UBX-ACK-NAK (0x05 0x00)

5.8.2.1 Message Not-Acknowledged

Message	**UBX-ACK-NAK**					
Description	**Message Not-Acknowledged**					
Firmware	Supported on: • u-blox 9 with protocol version 27.11					
Type	Output					
Comment	Output upon processing of an input message. NAK Message is sent as soon as possible but at least within one second.					
Message Structure	Header	Class	ID	Length (Bytes)	Payload	Checksum
	0xB5 0x62	0x05	0x00	2	see below	CK_A CK_B

Payload Contents:

0	U1	-	`clsID`	-	Class ID of the Not-Acknowledged Message
1	U1	-	`msgID`	-	Message ID of the Not-Acknowledged Message

5.9 UBX-CFG (0x06)

Configuration Input Messages: i.e. Configure the receiver..
Messages in the CFG class can be used to configure the receiver and poll current configuration values. Any messages in the CFG class sent to the receiver are either acknowledged (with message UBX-ACK-ACK) if processed successfully or rejected (with message UBX-ACK-NAK) if processing unsuccessfully.

5.9.1 UBX-CFG-ANT (0x06 0x13)

5.9.1.1 Antenna Control Settings

Message	**UBX-CFG-ANT**					
Description	**Antenna Control Settings**					
Firmware	Supported on: • u-blox 9 with protocol version 27.11					
Type	Get/Set					
Comment	**This message is deprecated in protocol versions greater than 23.01. Use** UBX-CFG-VALSET, UBX-CFG-VALGET, UBX-CFG-VALDEL **instead.** See the Legacy UBX Message Fields Reference for the corresponding configuration item. This message allows the user to configure the antenna supervisor. The antenna supervisor can be used to detect the status of an active antenna and control it. It can be used to turn off the supply to the antenna in the event of a short (for example) or to manage power consumption in Power Save Mode. Refer to Antenna Supervisor Configuration and the relevant Integration manual (IM) for more information regarding the behavior of the antenna supervisor. Refer to UBX-MON-HW for a description of the fields in the message used to obtain the status of the antenna. Note that not all pins can be used for antenna supervisor operation, it is recommended that you use the default pins, consult the Integration Manual if you need to use other pins.					
Message Structure	Header	Class	ID	Length (Bytes)	Payload	Checksum

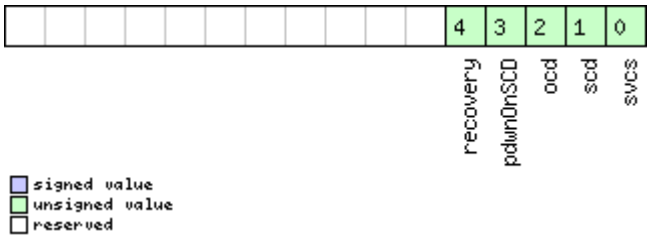
Payload Contents:

Byte Offset	Number Format	Scaling	Name	Unit	Description
0	X2	-	flags	-	Antenna Flag Mask (see graphic below)
2	X2	-	pins	-	Antenna Pin Configuration (see graphic below)

Bitfield flags

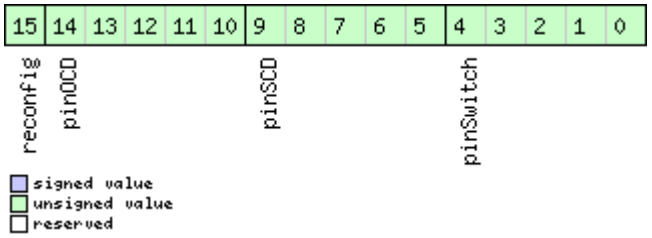
This graphic explains the bits of `flags`



Name	Description
`svcs`	Enable Antenna Supply Voltage Control Signal
`scd`	Enable Short Circuit Detection
`ocd`	Enable Open Circuit Detection
`pdwnOnSCD`	Power Down Antenna supply if Short Circuit is detected. (only in combination with Bit 1)
`recovery`	Enable automatic recovery from short state

Bitfield pins

This graphic explains the bits of `pins`



Name	Description
`pinSwitch`	PIO-Pin used for switching antenna supply
`pinSCD`	PIO-Pin used for detecting a short in the antenna supply
`pinOCD`	PIO-Pin used for detecting open/not connected antenna
`reconfig`	if set to one, and this command is sent to the receiver, the receiver will reconfigure the pins as specified.

5.9.2 UBX-CFG-CFG (0x06 0x09)

5.9.2.1 Clear, Save and Load configurations

Message	**UBX-CFG-CFG**
Description	**Clear, Save and Load configurations**
Firmware	Supported on: • u-blox 9 with protocol version 27.11
Type	Command
Comment	**This message is deprecated in protocol versions greater than 23.01. Use UBX-CFG-VALSET, UBX-CFG-VALGET, UBX-CFG-VALDEL instead.** See Receiver Configuration for a detailed description on how Receiver Configuration should be used. The behaviour of this message has changed. The three masks which were used to clear, save and load a subsection of configuration lost their meaning. It is no longer possible to save or clear a subsection of the configuration using this message. The behaviour of the masks is described as follows: • if any bit is set in the clearMask: all configuration in the selected non-volatile

	memory is deleted • if any bit is set in the saveMask: all current configuration is stored (copied) to the selected layers • if any bit is set in the loadMask: The curerent configuration is discarded and rebuilt from all the lower layers Note that commands can be combined. The sequence of execution is clear, save, then load. Also note that this message is considered deprecated. Use UBX-CFG-VALSET and UBX-CFG-VALDEL with the appropriate layers instead. These new messages support selective saving and clearing to retain the behaviour removed from this message.

	Header	Class	ID	Length (Bytes)	Payload	Checksum

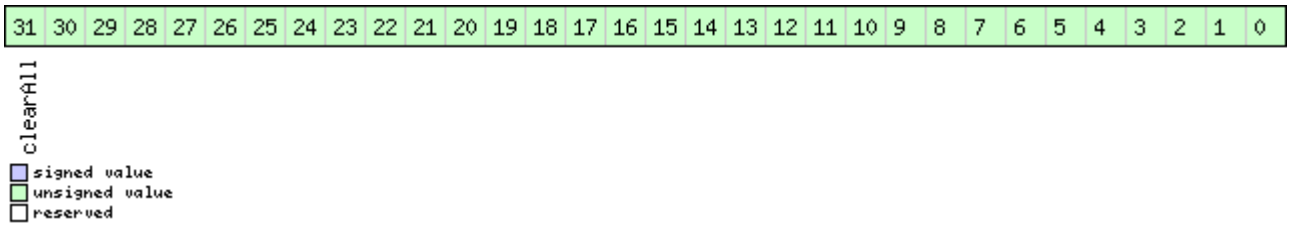
Start of optional block					
12	X1	-	`deviceMask`	-	Mask which selects the memory devices for saving and/or clearing operation Note that if a deviceMask is not provided, the receiver defaults the operation requested to Battery Backed RAM (BBR) and Flash (if available) (see graphic below)
End of optional block					

Bitfield clearMask

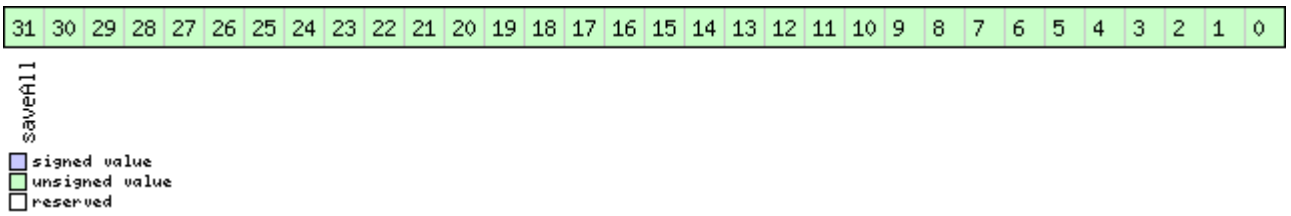
This graphic explains the bits of `clearMask`



Name	Description
clearAll	Clear all saved configuration from the selected non-volatile memory if any bit is set

Bitfield saveMask

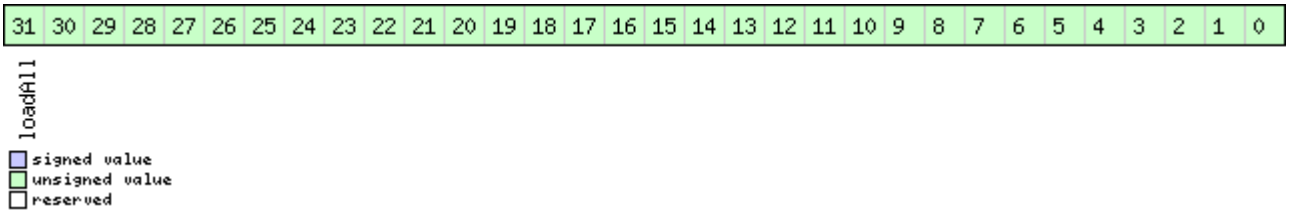
This graphic explains the bits of saveMask



Name	Description
saveAll	Save all current configuration to the selected non-volatile memory if any bit is set

Bitfield loadMask

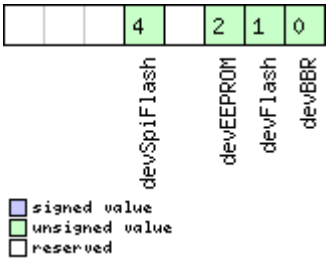
This graphic explains the bits of loadMask



Name	Description
loadAll	Discard current configuration and rebuilt it from lower non-volatile memory layers if any bit is set

Bitfield deviceMask

This graphic explains the bits of deviceMask



Name	Description
devBBR	Battery Backed RAM
devFlash	Flash
devEEPROM	EEPROM
devSpiFlash	SPI Flash

5.9.3 UBX-CFG-DAT (0x06 0x06)

5.9.4 UBX-CFG-DGNSS (0x06 0x70)

5.9.4.1 DGNSS configuration

Message	**UBX-CFG-DGNSS**					
Description	**DGNSS configuration**					
Firmware	Supported on: • u-blox 9 with protocol version 27.11 (**only with High Precision GNSS products**)					
Type	Get/Set					
Comment	**This message is deprecated in protocol versions greater than 23.01. Use** UBX-CFG-VALSET, UBX-CFG-VALGET, UBX-CFG-VALDEL **instead.** See the Legacy UBX Message Fields Reference for the corresponding configuration item. 5.9.5 UBX-CFG-GEOFENCE (0x06 0x69)

5.9.5.1 Geofencing configuration

Message	**UBX-CFG-GEOFENCE**
Description	**Geofencing configuration**
Firmware	Supported on: • u-blox 9 with protocol version 27.11
Type	Get/Set
Comment	**This message is deprecated in protocol versions greater than 23.01. Use** UBX-CFG-VALSET, UBX-CFG-VALGET, UBX-CFG-VALDEL **instead.** See the Legacy UBX Message Fields Reference for the corresponding configuration item. Gets or sets the geofencing configuration If the receiver is sent a valid new configuration, it will respond with a UBX-ACK-ACK message and immediately change to the new configuration. Otherwise the receiver will reject the request, by issuing a UBX-ACK-NAK and continuing operation with the previous configuration. Note that the acknowledge message does not indicate whether the PIO configuration has been successfully applied (pin assigned), it only indicates the successful configuration of the feature. The configured PIO must be previously unoccupied for successful assignment.

Message Structure	Header	Class	ID	Length (Bytes)	Payload	Checksum

0	U1	-	version	-	Message version (0x00 for this version)
1	U1	-	numFences	-	Number of geofences contained in this message. Note that the receiver can only store a limited number of geofences (currently 4).
2	U1	-	confLvl	-	Required confidence level for state evaluation. This value times the position's standard deviation (sigma) defines the confidence band. 0 = no confidence required 1 = 68% 2 = 95% 3 = 99.7% 4 = 99.99%
3	U1[1]	-	reserved1	-	Reserved
4	U1	-	pioEnabled	-	1 = Enable PIO combined fence state output, 0 = disable
5	U1	-	pinPolarity	-	PIO pin polarity. 0 = Low means inside, 1 = Low means outside. Unknown state is always high.
6	U1	-	pin	-	PIO pin number
7	U1[1]	-	reserved2	-	Reserved
Start of repeated block (numFences times)					
8 + 12*N	I4	1e-7	lat	deg	Latitude of the geofence circle center

5.9.6 UBX-CFG-GNSS (0x06 0x3E)

5.9.6.1 GNSS system configuration

Message	**UBX-CFG-GNSS**
Description	**GNSS system configuration**
Firmware	Supported on: • u-blox 9 with protocol version 27.11
Type	Get/Set
Comment	**This message is deprecated in protocol versions greater than 23.01. Use** UBX-CFG-VALSET, UBX-CFG-VALGET, UBX-CFG-VALDEL **instead.** See the Legacy UBX Message Fields Reference for the corresponding configuration item. Gets or sets the GNSS system channel sharing configuration. If the receiver is sent a valid new configuration, it will respond with a UBX-ACK-ACK message and immediately change to the new configuration. Otherwise the receiver will reject the request, by issuing a UBX-ACK-NAK and continuing operation with the previous configuration. Configuration requirements: • It is necessary for at least one major GNSS to be enabled, after applying the new configuration to the current one. • It is also required that at least 4 tracking channels are available to each enabled major GNSS, i.e. `maxTrkCh` must have a minimum value of 4 for each enabled major GNSS. • The number of tracking channels in use must not exceed the number of tracking channels available in hardware, and the sum of all reserved tracking channels needs to be less than or equal to the number of tracking channels in use. Notes: • To avoid cross-correlation issues, it is recommended that GPS and QZSS are always both enabled or both disabled. • Polling this message returns the configuration of all supported GNSS, whether enabled or not; it may also include GNSS unsupported by the particular product, but in such cases the enable flag will always be unset. • See section Satellite Numbering for a description of the GNSS IDs available. • Configuration specific to the GNSS system can be done via other messages (e.g. **UBX-CFG-SBAS**).

	Header	Class	ID	Length (Bytes)	Payload	Checksum

5.9.7.2 Information message configuration

Message	**UBX-CFG-INF**					
Description	**Information message configuration**					
Firmware	Supported on: • u-blox 9 with protocol version 27.11					
Type	Get/Set					
Comment	**This message is deprecated in protocol versions greater than 23.01. Use** UBX-CFG-VALSET, UBX-CFG-VALGET, UBX-CFG-VALDEL **instead.** The value of infMsgMask[x] below are that each bit represents one of the INF class messages (Bit 0 for ERROR, Bit 1 for WARNING and so on.). For a complete list, see the Message Class INF. Several configurations can be concatenated to one input message. In this case the payload length can be a multiple of the normal length. Output messages from the module contain only one configuration unit. Note that I/O Ports 1 and 2 correspond to serial ports 1 and 2. I/O port 0 is DDC. I/O port 3 is USB. I/O port 4 is SPI. I/O port 5 is reserved for future use.

5.9.9 UBX-CFG-LOGFILTER (0x06 0x47)

5.9.9.1 Data Logger Configuration

Message	**UBX-CFG-LOGFILTER**					
Description	**Data Logger Configuration**					
Firmware	Supported on: • u-blox 9 with protocol version 27.11					
Type	Get/Set					
Comment	**This message is deprecated in protocol versions greater than 23.01. Use** UBX-CFG-VALSET, UBX-CFG-VALGET, UBX-CFG-VALDEL **instead.** See the Legacy UBX Message Fields Reference for the corresponding configuration item. This message can be used to configure the data logger, i.e. to enable/disable the log recording and to get/set the position entry filter settings. Position entries can be filtered based on time difference, position difference or current speed thresholds. Position and speed filtering also have a minimum time interval. A position is logged if any of the thresholds are exceeded. If a threshold is set to zero it is ignored. The maximum rate of position logging is 1Hz. The filter settings will be configured to the provided values only if the 'applyAllFilterSettings' flag is set. This allows the recording to be enabled/disabled independently of configuring the filter settings. It is supported to configure the data logger in the absence of a logging file. By doing so, once the logging file is created, the data logger configuration will take effect immediately and logging recording and filtering will activate according to the configuration.

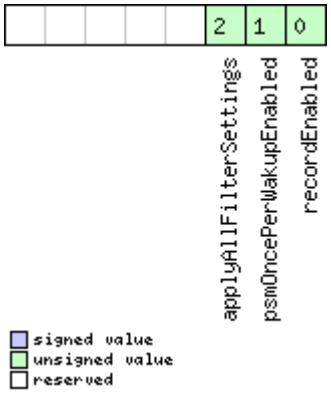
1	X1	-	`flags`	-	Flags (see graphic below)
2	U2	-	`minInterval`	s	Minimum time interval between logged positions (0 = not set). **This is only applied in combination with the speed and/or position thresholds.** If both minInterval and timeThreshold are set, minInterval must be less than or equal to timeThreshold.
4	U2	-	`timeThreshold`	s	If the time difference is greater than the threshold then the position is logged (0 = not set).
6	U2	-	`speedThreshold`	m/s	If the current speed is greater than the threshold then the position is logged (0 = not set). minInterval also applies
8	U4	-	`positionThreshold`	m	If the 3D position difference is greater than the threshold then the position is logged (0 = not set). minInterval also applies

Bitfield flags

This graphic explains the bits of `flags`



Name	Description
recordEnabled	1 = enable recording, 0 = disable recording
psmOncePerWakupEnabled	1 = enable recording only one single position per PSM on/off mode wake-up period, 0 = disable once per wake-up
applyAllFilterSettings	1 = apply all filter settings, 0 = only apply recordEnabled

5.9.15.2 Port configuration for UART ports

Message	**UBX-CFG-PRT**
Description	**Port configuration for UART ports**
Firmware	Supported on: • u-blox 9 with protocol version 27.11
Type	Get/Set
Comment	**This message is deprecated in protocol versions greater than 23.01. Use** UBX-CFG-VALSET, UBX-CFG-VALGET, UBX-CFG-VALDEL **instead.** See the Legacy UBX Message Fields Reference for the corresponding configuration item. Several configurations can be concatenated to one input message. In this case the payload length can be a multiple of the normal length (see the other versions of CFG-PRT). Output messages from the module contain only one configuration unit. Note that this message can affect baud rate and other transmission parameters. Because there may be messages queued for transmission there may be uncertainty about which protocol applies to such messages. In addition a message currently in transmission may be corrupted by a protocol change. Host data reception parameters may have to be changed to be able to receive future messages, including the acknowledge message resulting from the CFG-PRT message.

5.9.17 UBX-CFG-RATE (0x06 0x08)

5.9.17.1 Navigation/Measurement Rate Settings

Message	**UBX-CFG-RATE**					
Description	**Navigation/Measurement Rate Settings**					
Firmware	Supported on: • u-blox 9 with protocol version 27.11					
Type	Get/Set					
Comment	**This message is deprecated in protocol versions greater than 23.01. Use** UBX-CFG-VALSET, UBX-CFG-VALGET, UBX-CFG-VALDEL **instead.** See the Legacy UBX Message Fields Reference for the corresponding configuration item. This message allows the user to alter the rate at which navigation solutions (and the measurements that they depend on) are generated by the receiver. The calculation of the navigation solution will always be aligned to the top of a second zero (first second of the week) of the configured reference time system. (Navigation period is an integer multiple of the measurement period in protocol versions greater than 17) • Each measurement triggers the measurements generation and raw data output. • The navRate value defines that every nth measurement triggers a navigation epoch. • The update rate has a direct influence on the power consumption. The more fixes that are required, the more CPU power and communication resources are required. • For most applications a 1 Hz update rate would be sufficient. • When using Power Save Mode, measurement and navigation rate can differ from the values configured here.

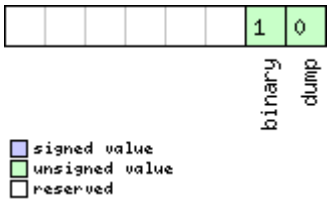
Bitfield flags

This graphic explains the bits of `flags`



Name	Description
`active`	If set enable time pulse; if pin assigned to another function, other function takes precedence. Must be set for FTS variant.
`lockGnssFreq`	If set synchronize time pulse to GNSS as soon as GNSS time is valid. If not set, or before GNSS time is valid use local clock. This flag is ignored by the FTS product variant; in this case the receiver always locks to the best available time/frequency reference (which is not necessarily GNSS).
`lockedOtherSet`	If set the receiver switches between the timepulse settings given by 'freqPeriodLocked' & 'pulseLenLocked' and those given by 'freqPeriod' & 'pulseLen'. The 'Locked' settings are used where the receiver has an accurate sense of time. For non-FTS products, this occurs when GNSS solution with a reliable time is available, but for FTS products the setting syncMode field governs behavior. In all cases, the receiver only uses 'freqPeriod' & 'pulseLen' when the flag is unset.
`isFreq`	If set 'freqPeriodLock' and 'freqPeriod' are interpreted as frequency, otherwise interpreted as period.
`isLength`	If set 'pulseLenRatioLock' and 'pulseLenRatio' interpreted as pulse length, otherwise interpreted as duty cycle.
`alignToTow`	Align pulse to top of second (period time must be integer fraction of 1s). Also set 'lockGnssFreq' to use this feature. This flag is ignored by the FTS product variant; it is assumed to be always set (as is lockGnssFreq). Set maxSlewRate and maxPhaseCorrRate fields of **UBX-CFG-SMGR** to 0 to disable alignment.
`polarity`	Pulse polarity: 0: falling edge at top of second 1: rising edge at top of second

Bitfield flags Description continued

Name	Description
gridUtcGnss	Timegrid to use: 0: UTC 1: GPS 2: GLONASS 3: BeiDou 4: Galileo This flag is only relevant if 'lockGnssFreq' and 'alignToTow' are set. Note that configured GNSS time is estimated by the receiver if locked to any GNSS system. If the receiver has a valid GNSS fix it will attempt to steer the TP to the specified time grid even if the specified time is not based on information from the constellation's satellites. To ensure timing based purely on a given GNSS, restrict the supported constellations in UBX-CFG-GNSS.
syncMode	Sync Manager lock mode to use: 0: switch to 'freqPeriodLock' and 'pulseLenRatioLock' as soon as Sync Manager has an accurate time, never switch back to 'freqPeriod' and 'pulseLenRatio' 1: switch to 'freqPeriodLock' and 'pulseLenRatioLock' as soon as Sync Manager has an accurate time, and switch back to 'freqPeriod' and 'pulseLenRatio' as soon as time gets inaccurate This field is only relevant for the FTS product variant. This field is only relevant if the flag 'lockedOtherSet' is set.

5.9.23.1 Deletes values corresponding to provided keys

Message	**UBX-CFG-VALDEL**
Description	**Deletes values corresponding to provided keys**
Firmware	Supported on: • u-blox 9 with protocol version 27.11
Type	Set
Comment	Overview: • This message can be used to delete saved configuration to effectively revert them to defaults. • This message can delete saved configuration from the Flash configuration layer and the BBR configuration layer. The changes won't be effective until these layers are loaded into the RAM layer. • This message is limited to containing a maximum of 64 keys up for deletion; i. e. N is a maximum of 64. • This message can be used multiple times and every time the result will be applied immediately. To send this message multiple times with the result being applied at the end, see version 1 of `UBX-CFG-VALDEL` that supports transactions. • This message does not check if the resulting configuration is valid.

	• See Receiver Configuration for details. This message returns a UBX-ACK-NAK and no configuration is applied: • if any key is unknown to the receiver FW • if the layers bitfield does not specify a layer to delete a value from Notes: • If a key is sent multiple times within the same message, then the value is effectively deleted only once. • Attempting to delete items that have not been set before, or that have already been deleted, is considered a valid request

Message	**UBX-CFG-VALDEL**
Description	**Deletes values corresponding to provided keys within a transaction**
Firmware	Supported on: • u-blox 9 with protocol version 27.11
Type	Set
Comment	Overview: • This message can be used to delete saved configuration to effectively revert them to defaults. • This message can delete saved configuration from the Flash configuration layer and the BBR configuration layer. The changes won't be effective until these layers are loaded into the RAM layer. • This message is limited to containing a maximum of 64 keys up for deletion; i. e. This message returns a UBX-ACK-NAK, cancels any started transaction, and no configuration is applied: • if any key within a transaction is unknown to the receiver FW • if an invalid transaction state transition is requested • if the layers bitfield changes within a transaction • if the layers bitfield does not specify a layer to delete a value from Notes: • Any request for another UBX-CFG- message type (including UBX-CFG-VALSET and UBX-CFG-VALGET) will cancel any started transaction, and no configuration is applied. • This message can be sent with no keys to delete for the purposes of managing the transaction state transition. • If a key is sent multiple times within the same message or within the same transaction, then the value is effectively deleted only once. • Attempting to delete items that have not been set before, or that have already been deleted, is considered a valid request

5.9.24 UBX-CFG-VALGET (0x06 0x8B)

5.9.24.1 Get Configuration Items

Message	**UBX-CFG-VALGET**
Description	**Get Configuration Items**
Firmware	Supported on: • u-blox 9 with protocol version 27.11
Type	Poll Request
Comment	This message is used to read configuration items from the receiver. It returns the configuration data for the specified items and layer. A UBX-CFG-NAK message is returned in case one or more items are unknown to the receiver or when the number of requested items is greater than 64. Otherwise a UBX-CFG-ACK message is returned. The configuration items are identified by their configuration key IDs. Keys can be complete key values (group and item specifiers) or wild-card specifications. A complete key value will constitute a request for one key-value pair. A key value which has a valid group specifier and 0xffff in the item part of the key value (bits 0-15) constitutes a request for all items in the specified group. A key with a value of 0xfff in the group part of the key value (bits 16-27) is a request for all items known to the receiver in all groups. The response message is limited to containing a maximum of 64 key-value pairs. If there are wild-card specifications then there may be more than 64 possible responses. In order to handle this, the 'position' field can specify that the response message should skip this number of key-value pairs before it starts constructing the message. This allows a large set of values to be retrieved 64 at a time. If the response contains less than 64 key-value pairs then all values have been reported, otherwise there may be more to read. See Receiver Configuration for details.

Message	**UBX-CFG-VALSET**
Description	**Sets values corresponding to provided key-value pairs**
Firmware	Supported on: • u-blox 9 with protocol version 27.11
Type	Set
Comment	Overview: • This message is used to set a configuration by providing configuration data (a list of key and value pairs), which identify the configuration parameters to change, and their new values. • This message is limited to containing a maximum of 64 key-value pairs. • This message can be used multiple times and every time the result will be applied immediately. To send this message multiple times with the result being applied at the end, see version 1 of `UBX-CFG-VALSET` that supports transactions.

	• See Receiver Configuration for details. This message returns a UBX-ACK-NAK and no configuration is applied: • if any key is unknown to the receiver FW • if the layers bitfield does not specify a layer to save a value to • if the requested configuration is not valid. The validity of a configuration is checked only if the message requests to apply the configuration to the RAM configuration layer. Notes: • If a key is sent multiple times within the same message, then the value eventually being applied is the last sent.

5.9.25.2 Sets values corresponding to provided key-value pairs within a transaction

Message	**UBX-CFG-VALSET**
Description	**Sets values corresponding to provided key-value pairs within a transaction**
Firmware	Supported on: • u-blox 9 with protocol version 27.11
Type	Set
Comment	Overview: • This message is used to set a configuration by providing configuration data (a list of key and value pairs), which identify the configuration parameters to change, and their new values. • This message is limited to containing a maximum of 64 key-value pairs. • This message can be used multiple times with the result being managed within a transaction. Within a transaction there is no limit on the number key-value pairs; a transaction is effectively limited to the number of known keys. • See Receiver Configuration for details. • See version 0 of UBX-CFG-VALSET for simplified version of this message. This message returns a UBX-ACK-NAK, cancels any started transaction, and no configuration is applied: • if any key within a transaction is unknown to the receiver FW • if an invalid transaction state transition is requested • if the layers bitfield changes within a transaction • if the layers bitfield does not specify a layer to save a value to This message returns a UBX-ACK-NAK, and no configuration is applied: • if the requested configuration is not valid. While in a transaction context, only the last message that requests to apply the transaction returns a NAK. The validity of a configuration is checked only if the message requests to apply the configuration to the RAM configuration layer. This also applies to a transaction-less request. Notes: • Any request for another UBX-CFG-message type (including UBX-CFG-VALDEL and UBX-CFG-VALGET) will cancel any started transaction, and no configuration is applied. • This message can be sent with no key/values to set for the purposes of managing the transaction state transition. • If a key is sent multiple times within the same message or within the same transaction, then the value eventually being applied is the last sent.

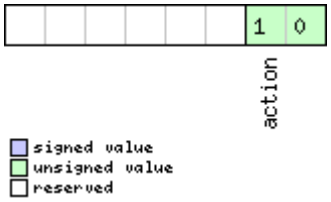
Bitfield transaction

This graphic explains the bits of transaction



Name	Description
action	Transaction action to be applied: 0: Transactionless UBX-CFG-VALSET: In the next UBX-CFG-VALSET, it can be either 0 or 1. If a transaction has not yet been started, the incoming configuration is applied (if valid). If a transaction has already been started, cancels any started transaction and the incoming configuration is applied (if valid). 1: (Re)Start set transaction: In the next UBX-CFG-VALSET, it can be either 0, 1, 2 or 3. If a transaction has not yet been started, a transaction will be started. If a transaction has already been started, restarts the transaction, effectively removing all previous non-applied UBX-CFG-VALSET messages. 2: Set transaction ongoing: In the next UBX-CFG-VALSET, it can be either 0, 1, 2 or 3. 3: Apply and end a set transaction: In the next UBX-CFG-VALSET, it can be either 0 or 1.

5.10 UBX-INF (0x04)

Information Messages: i.e. Printf-Style Messages, with IDs such as Error, Warning, Notice. Messages in the INF class are used to output strings in a printf style from the firmware or application code. All INF messages have an associated type to indicate the kind of message.

5.10.1 UBX-INF-DEBUG (0x04 0x04)

5.10.1.1 ASCII output with debug contents

Message	**UBX-INF-DEBUG**					
Description	**ASCII output with debug contents**

5.11 UBX-LOG (0x21)

Logging Messages: i.e. Log creation, deletion, info and retrieval.
Messages in the LOG class are used to configure and report status information of the logging and batching features.

5.11.1 UBX-LOG-CREATE (0x21 0x07)

5.11.1.1 Create Log File

Message	**UBX-LOG-CREATE**					
Description	**Create Log File**					
Firmware	Supported on: • u-blox 9 with protocol version 27.11					
Type	Command					
Comment	This message is used to create an initial logging file and activate the logging subsystem. UBX-ACK-ACK or UBX-ACK-NAK are returned to indicate success or failure. This message does not handle activation of recording or filtering of log entries (see UBX-CFG-LOGFILTER).					
Message Structure	Header	Class	ID	Length (Bytes)	Payload	Checksum
	0xB5 0x62	0x21	0x07	8	see below	CK_A CK_B

Payload Contents:

Byte Offset	Number Format	Scaling	Name	Unit	Description
0	U1	-	version	-	Message version (0x00 for this version)
1	X1	-	logCfg	-	Config flags (see graphic below)
2	U1	-	reserved1	-	Reserved
3	U1	-	logSize	-	Indicates the size of the log: 0 (maximum safe size): Ensures that logging will not be interrupted and enough space will be left available for all other uses of the filestore 1 (minimum size): 2 (user defined): See 'userDefinedSize' below
4	U4	-	userDefinedSize	bytes	Sets the maximum amount of space in the filestore that can be used by the logging task. This field is only applicable if logSize is set to user defined.

5.11.2 UBX-LOG-ERASE (0x21 0x03)

5.11.2.1 Erase Logged Data

Message	**UBX-LOG-ERASE**					
Description	**Erase Logged Data**					
Firmware	Supported on: • u-blox 9 with protocol version 27.11					
Type	Command					
Comment	This message deactivates the logging system and erases all logged data. UBX-ACK-ACK or UBX-ACK-NAK are returned to indicate success or failure.					
Message Structure	Header	Class	ID	Length (Bytes)	Payload	Checksum
	0xB5 0x62	0x21	0x03	0	see below	CK_A CK_B

5.11.3 UBX-LOG-FINDTIME (0x21 0x0E)

5.11.3.1 Find index of a log entry based on a given time

Message	**UBX-LOG-FINDTIME**					
Description	**Find index of a log entry based on a given time**					
Firmware	Supported on: • u-blox 9 with protocol version 27.11					
Type	Input					
Comment	This message can be used for a time-based search of a log. It can find the index of the first log entry with time equal to the given time, otherwise the index of the most recent entry with time less than the given time. This index can then be used with the UBX-LOG-RETRIEVE message to provide time-based retrieval of log entries. Searching a log is effective for a given time later than the base date (January 1st, 2004). Searching a log for a given time earlier than the base date will result in an 'entry not found' response. Searching a log for a given time greater than the last recorded entry's time will return the index of the last recorded entry.

5.11.4 UBX-LOG-INFO (0x21 0x08)

5.11.4.1 Poll for log information

Message	**UBX-LOG-INFO**					
Description	**Poll for log information**					
Firmware	Supported on: • u-blox 9 with protocol version 27.11					
Type	Poll Request

5.11.4.2 Log information

Message	**UBX-LOG-INFO**					
Description	**Log information**					
Firmware	Supported on: • u-blox 9 with protocol version 27.11					
Type	Output					
Comment	This message is used to report information about the logging subsystem. Note: • The reported maximum log size will be smaller than that originally specified in LOG-CREATE due to logging and filestore implementation overheads. • Log entries are compressed in a variable length fashion, so it may be difficult to predict log space usage with any precision. • There may be times when the receiver does not have an accurate time (e.g. if the week number is not yet known), in which case some entries will not have a timestamp. This may result in the oldest/newest entry time values not taking account of these entries.

5.11.8 UBX-LOG-RETRIEVE (0x21 0x09)

5.11.8.1 Request log data

Message	**UBX-LOG-RETRIEVE**					
Description	**Request log data**					
Firmware	Supported on: • u-blox 9 with protocol version 27.11					
Type	Command					
Comment	This message is used to request logged data (log recording must first be disabled, see UBX-CFG-LOGFILTER). Log entries are returned in chronological order, using the messages UBX-LOG-RETRIEVEPOS and UBX-LOG-RETRIEVESTRING. If the odometer was enabled at the time a position was logged, then message UBX-LOG-RETRIEVEPOSEXTRA will also be used. The maximum number of entries that can be returned in response to a single UBX-LOG-RETRIEVE message is 256. If more entries than this are required the message will need to be sent multiple times with different startNumbers. The retrieve will be stopped if any UBX-LOG message is received. The speed of transfer can be maximized by using a high data rate and temporarily stopping the GPS processing (see UBX-CFG-RST).					
Message Structure	Header	Class	ID	Length (Bytes)	Payload	Checksum

5.13 UBX-MON (0x0A)

Monitoring Messages: i.e. Communication Status, CPU Load, Stack Usage, Task Status.
Messages in the MON class are used to report the receiver status, such as CPU load, stack usage, I/O subsystem statistics etc.

5.13.1 UBX-MON-COMMS (0x0A 0x36)

5.13.1.1 Comm port information

Message	**UBX-MON-COMMS**					
Description	**Comm port information**					
Firmware	Supported on: • u-blox 9 with protocol version 27.11					
Type	Periodic/Polled					
Comment	Consolidated communications information for all ports. The size of the message is determined by the number of ports that are in use on the receiver. A port is only included if communication, either send or receive, has been initiated on that port.					
Message Structure	Header	Class	ID	Length (Bytes)	Payload	Checksum
	0xB5 0x62	0x0A	0x36	8 + 40*nPorts	see below	CK_A CK_B

Payload Contents:

Byte Offset	Number Format	Scaling	Name	Unit	Description
0	U1	-	`version`	-	Message version (0x00 for this version)
1	U1	-	`nPorts`	-	Number of ports included
2	X1	-	`txErrors`	-	tx error bitmask (see graphic below)
3	U1[1]	-	`reserved1`	-	Reserved
4	U1[4]	-	`protIds`		The identifiers of the protocols reported in the msgs array. 0: UBX, 1: NMEA, 2: RTCM2, 5: RTCM3, 256: No protocol reported.
Start of repeated block (nPorts times)					
8 + 40*N	U2	-	`portId`	-	Unique identifier for the port. See section Communications ports in Integration manual for details.
10 + 40*N	U2	-	`txPending`	bytes	Number of bytes pending in transmitter buffer
12 + 40*N	U4	-	`txBytes`	bytes	Number of bytes ever sent
16 + 40*N	U1	-	`txUsage`	%	Maximum usage transmitter buffer during the last sysmon period
17 + 40*N	U1	-	`txPeakUsage`	%	Maximum usage transmitter buffer
18 + 40*N	U2	-	`rxPending`	bytes	Number of bytes in receiver buffer
20 + 40*N	U4	-	`rxBytes`	bytes	Number of bytes ever received
24 + 40*N	U1	-	`rxUsage`	%	Maximum usage receiver buffer during the last sysmon period
25 + 40*N	U1	-	`rxPeakUsage`	%	Maximum usage receiver buffer
26 + 40*N	U2	-	`overrunErrs`	-	Number of 100ms timeslots with overrun errors

UBX-MON-COMMS continued

Byte Offset	Number Format	Scaling	Name	Unit	Description
28 + 40*N	U2[4]	-	msgs	msg	Number of successfully parsed messages for each protocol. The reported protocols are identified through the protIds field.
36 + 40*N	U1[8]	-	reserved2	-	Reserved
44 + 40*N	U4	-	skipped	bytes	Number of skipped bytes

5.13.2 UBX-MON-GNSS (0x0A 0x28)

5.13.2.1 Information message major GNSS selection

Message	**UBX-MON-GNSS**					
Description	**Information message major GNSS selection**					
Firmware	Supported on: • u-blox 9 with protocol version 27.11					
Type	Polled					
Comment	This message reports major GNSS selection. It does this by means of bit masks in U1 fields. Each bit in a bit mask corresponds to one major GNSS. Augmentation systems are not reported.					
Message Structure	Header	Class	ID	Length (Bytes)	Payload	Checksum
	0xB5 0x62	0x0A	0x28	8	see below	CK_A CK_B

Payload Contents:

Byte Offset	Number Format	Scaling	Name	Unit	Description
0	U1	-	version	-	Message version (0x01for this version)
1	X1	-	supported	-	A bit mask showing the major GNSS that can be supported by this receiver (see graphic below)

UBX-MON-GNSS continued

Byte Offset	Number Format	Scaling	Name	Unit	Description
2	X1	-	defaultGnss	-	A bit mask showing the default major GNSS selection. If the default major GNSS selection is currently configured in the efuse for this receiver, it takes precedence over the default major GNSS selection configured in the executing firmware of this receiver. (see graphic below)
3	X1	-	enabled	-	A bit mask showing the current major GNSS selection enabled for this receiver (see graphic below)
4	U1	-	simultaneous	-	Maximum number of concurrent major GNSS that can be supported by this receiver
5	U1[3]	-	reserved1	-	Reserved

5.13.3 UBX-MON-HW2 (0x0A 0x0B)

5.13.3.1 Extended Hardware Status

Message	**UBX-MON-HW2**					
Description	**Extended Hardware Status**					
Firmware	Supported on: • u-blox 9 with protocol version 27.11					
Type	Periodic/Polled					
Comment	**This message is deprecated in this protocol version. Use** UBX-MON-HW3 **and** UBX-MON-RF **instead.** Status of different aspects of the hardware such as Imbalance, Low-Level Configuration and POST Results. The first four parameters of this message represent the complex signal from the RF front end. The following rules of thumb apply: • The smaller the absolute value of the variable ofsI and ofsQ, the better. • Ideally, the magnitude of the I-part (magI) and the Q-part (magQ) of the complex signal should be the same.					
Message Structure	Header	Class	ID	Length (Bytes)	Payload	Checksum
	0xB5 0x62	0x0A	0x0B	28	see below	CK_A CK_B

Payload Contents:

Byte Offset	Number Format	Scaling	Name	Unit	Description
0	I1	-	ofsI	-	Imbalance of I-part of complex signal, scaled (-128 = max. negative imbalance, 127 = max. positive imbalance)

UBX-MON-HW2 continued

Byte Offset	Number Format	Scaling	Name	Unit	Description
1	U1	-	magI	-	Magnitude of I-part of complex signal, scaled (0 = no signal, 255 = max. magnitude)
2	I1	-	ofsQ	-	Imbalance of Q-part of complex signal, scaled (-128 = max. negative imbalance, 127 = max. positive imbalance)
3	U1	-	magQ	-	Magnitude of Q-part of complex signal, scaled (0 = no signal, 255 = max. magnitude)
4	U1	-	cfgSource	-	Source of low-level configuration (114 = ROM, 111 = OTP, 112 = config pins, 102 = flash image)
5	U1[3]	-	reserved1	-	Reserved
8	U4	-	lowLevCfg	-	Low-level configuration (obsolete in protocol versions greater than 15)
12	U1[8]	-	reserved2	-	Reserved
20	U4	-	postStatus	-	POST status word
24	U1[4]	-	reserved3	-	Reserved

5.13.4 UBX-MON-HW3 (0x0A 0x37)

5.13.4.1 HW I/O pin information

Message	**UBX-MON-HW3**					
Description	**HW I/O pin information**					
Firmware	Supported on: • u-blox 9 with protocol version 27.11					
Type	Periodic/Polled					
Comment	This message contains information specific to each HW I/O pin, for example whether the pin is set as Input or Output. For the antenna supervisor status and other RF status information, see the UBX-MON-RF message.					
Message Structure	Header	Class	ID	Length (Bytes)	Payload	Checksum
	0xB5 0x62	0x0A	0x37	22 + 6*nPins	see below	CK_A CK_B

Payload Contents:

Byte Offset	Number Format	Scaling	Name	Unit	Description
0	U1	-	version	-	Message version (0x00 for this version)
1	U1	-	nPins	-	The number of I/O pins included
2	X1	-	flags	-	Flags (see graphic below)
3	CH[10]	-	hwVersion	-	Zero-terminated Hardware Version String (same as that returned in the UBX-MON-VER message)

5.14.2 UBX-NAV-DOP (0x01 0x04)

5.14.2.1 Dilution of precision

Message	**UBX-NAV-DOP**					
Description	**Dilution of precision**					
Firmware	Supported on: • u-blox 9 with protocol version 27.11					
Type	Periodic/Polled					
Comment	• DOP values are dimensionless. • All DOP values are scaled by a factor of 100. If the unit transmits a value of e.g. 156, the DOP value is 1.56.

Name	Description
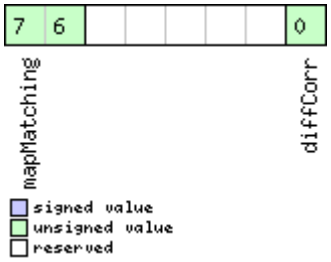
gpsFixOk	1 = position and velocity valid and within DOP and ACC Masks.
diffSoln	1 = differential corrections were applied
wknSet	1 = Week Number valid (see section Time validity in Integration manual for details)
towSet	1 = Time of Week valid (see section Time validity in Integration manual for details)

Bitfield fixStat

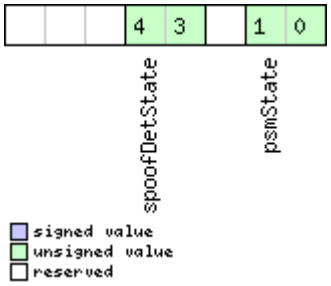
This graphic explains the bits of fixStat



Name	Description
diffCorr	1 = differential corrections available
mapMatching	map matching status: 00: none 01: valid but not used, i.e. map matching data was received, but was too old 10: valid and used, map matching data was applied 11: valid and used, map matching data was applied. In case of sensor unavailability map matching data enables dead reckoning. This requires map matched latitude/longitude or heading data.

Bitfield flags2

This graphic explains the bits of flags2



Name	Description
psmState	power save mode state 0: ACQUISITION [or when psm disabled] 1: TRACKING 2: POWER OPTIMIZED TRACKING 3: INACTIVE

Bitfield flags2 Description continued

Name	Description
spoofDetState	Spoofing detection state 0: Unknown or deactivated 1: No spoofing indicated 2: Spoofing indicated 3: Multiple spoofing indications Note that the spoofing state value only reflects the dector state for the current navigation epoch. As spoofing can be detected most easily at the transition from real signal to spoofing signal, this is also where the detector is triggered the most. I.e. a value of 1 - No spoofing indicated does not mean that the receiver is not spoofed, it simply states that the detector was not triggered in this epoch.

5.15.1 UBX-RXM-MEASX (0x02 0x14)

5.15.1.1 Satellite Measurements for RRLP

Message	**UBX-RXM-MEASX**					
Description	**Satellite Measurements for RRLP**					
Firmware	Supported on: • u-blox 9 with protocol version 27.11					
Type	Periodic/Polled					
Comment	The message payload data is, where possible and appropriate, according to the Radio Resource LCS (Location Services) Protocol (RRLP) [1]. One exception is the satellite and GNSS ids, which here are given according to the Satellite Numbering scheme. The correct satellites have to be selected and their satellite ID translated accordingly [1, tab. A.10.14] for use in a RRLP Measure Position Response Component. Similarly, the measurement reference time of week has to be forwarded correctly (modulo 14400000 for the 24 LSB GPS measurements variant, modulo 3600000 for the 22 LSB Galileo and Additional Navigation Satelllite Systems (GANSS) measurements variant) of the RRLP measure position response to the SMLC. 5.15.3 UBX-RXM-RAWX (0x02 0x15)

5.15.3.1 Multi-GNSS Raw Measurement Data

Message	**UBX-RXM-RAWX**					
Description	**Multi-GNSS Raw Measurement Data**					
Firmware	Supported on: • u-blox 9 with protocol version 27.11 (**only with High Precision GNSS products**)					
Type	Periodic/Polled					
Comment	This message contains the information needed to be able to generate a RINEX 3 multi-GNSS observation file. This message contains pseudorange, Doppler, carrier phase, phase lock and signal quality information for GNSS satellites once signals have been synchronized. This message supports all active GNSS. The only difference between this version of the message and the previous version (**UBX-RXM-RAWX-DATA0**) is the addition of the version field.					
Message Structure	Header	Class	ID	Length (Bytes)	Payload	Checksum
	0xB5 0x62	0x02	0x15	16 + 32*numMeas	see below	CK_A CK_B

Payload Contents:

Byte Offset	Number Format	Scaling	Name	Unit	Description
0	R8	-	`rcvTow`	s	Measurement time of week in receiver local time approximately aligned to the GPS time system. The receiver local time of week, week number and leap second information can be used to translate the time to other time systems. More information about the difference in time systems can be found in RINEX 3 documentation. For a receiver operating in GLONASS only mode, UTC time can be determined by subtracting the leapS field from GPS time regardless of whether the GPS leap seconds are valid.
8	U2	-	`week`	weeks	GPS week number in receiver local time.
10	I1	-	`leapS`	s	GPS leap seconds (GPS-UTC). This field represents the receiver's best knowledge of the leap seconds offset. A flag is given in the recStat bitfield to indicate if the leap seconds are known.
11	U1	-	`numMeas`	-	Number of measurements to follow
12	X1	-	`recStat`	-	Receiver tracking status bitfield (see graphic below)
13	U1	-	`version`	-	Message version (0x01 for this version)
14	U1[2]	-	`reserved1`	-	Reserved
Start of repeated block (numMeas times)

Byte Offset	Number Format	Scaling	Name	Unit	Description
16 + 32*N	R8	-	prMes	m	Pseudorange measurement [m]. GLONASS inter frequency channel delays are compensated with an internal calibration table.
24 + 32*N	R8	-	cpMes	cycles	Carrier phase measurement [cycles]. The carrier phase initial ambiguity is initialized using an approximate value to make the magnitude of the phase close to the pseudorange measurement. Clock resets are applied to both phase and code measurements in accordance with the RINEX specification.
32 + 32*N	R4	-	doMes	Hz	Doppler measurement (positive sign for approaching satellites) [Hz]
36 + 32*N	U1	-	gnssId	-	GNSS identifier (see Satellite Numbering for a list of identifiers)
37 + 32*N	U1	-	svId	-	Satellite identifier (see Satellite Numbering)
38 + 32*N	U1	-	sigId	-	New style signal identifier (see Signal Identifiers).

40 + 32*N	U2	-	locktime	ms	Carrier phase locktime counter (maximum 64500ms)
42 + 32*N	U1	-	cno	dBHz	Carrier-to-noise density ratio (signal strength) [dB-Hz]
43 + 32*N	X1	0.01*2^n	prStdev	m	Estimated pseudorange measurement standard deviation (see graphic below)
44 + 32*N	X1	0.004	cpStdev	cycles	Estimated carrier phase measurement standard deviation (note a raw value of 0x0F indicates the value is invalid) (see graphic below)
45 + 32*N	X1	0.002*2^n	doStdev	Hz	Estimated Doppler measurement standard deviation. (see graphic below)

5.18 UBX-UPD (0x09)

Firmware Update Messages: i.e. Memory/Flash erase/write, Reboot, Flash identification, etc.. Messages in the UPD class are used to update the firmware and identify any attached flash device.

5.18.1 UBX-UPD-SOS (0x09 0x14)

5.18.1.1 Poll Backup File Restore Status

Message	**UBX-UPD-SOS**					
Description	**Poll Backup File Restore Status**					
Firmware	Supported on: • u-blox 9 with protocol version 27.11					
Type	Poll Request					
Comment	Sending this (empty / no-payload) message to the receiver results in the receiver returning a System Restored from Backup message as defined below.					
Message Structure	Header	Class	ID	Length (Bytes)	Payload	Checksum
	0xB5 0x62	0x09	0x14	0	see below	CK_A CK_B

5.18.1.2 Create Backup File in Flash

Message	**UBX-UPD-SOS**					
Description	**Create Backup File in Flash**					
Firmware	Supported on: • u-blox 9 with protocol version 27.11					
Type	Command					
Comment	The host can send this message in order to save part of the BBR memory in a file in flash file system. The feature is designed in order to emulate the presence of the backup battery even if it is not present; the host can issue the save on shutdown command before switching off the device supply. It is recommended to issue a GNSS stop command before, in order to keep the BBR memory content consistent.					
Message Structure	Header	Class	ID	Length (Bytes)	Payload	Checksum
	0xB5 0x62	0x09	0x14	4	see below	CK_A CK_B

5.18.1.3 Clear Backup in Flash

Message	**UBX-UPD-SOS**					
Description	**Clear Backup in Flash**					
Firmware	Supported on: • u-blox 9 with protocol version 27.11					
Type	Command					
Comment	The host can send this message in order to erase the backup file present in flash. It is recommended that the clear operation is issued after the host has received the notification that the memory has been restored after a reset. Alternatively the host can parse the startup string 'Restored data saved on shutdown' or poll the UBX-UPD-SOS message for getting the status.

Message	**UBX-UPD-SOS**					
Description	**Backup File Creation Acknowledge**					
Firmware	Supported on: • u-blox 9 with protocol version 27.11					
Type	Output					
Comment	The message is sent from the device as confirmation of creation of a backup file in flash. The host can safely shut down the device after received this message.					
Message Structure	Header	Class	ID	Length (Bytes)	Payload	Checksum
	0xB5 0x62	0x09	0x14	8	see below	CK_A CK_B

5.18.1.5 System Restored from Backup

Message	**UBX-UPD-SOS**					
Description	**System Restored from Backup**					
Firmware	Supported on: • u-blox 9 with protocol version 27.11					
Type	Output					
Comment	The message is sent from the device to notify the host the BBR has been restored from a backup file in flash. The host should clear the backup file after receiving this message. If the UBX-UPD-SOS message is polled, this message will be resent.					
Message Structure	Header	Class	ID	Length (Bytes)	Payload	Checksum

6 Configuration Interface

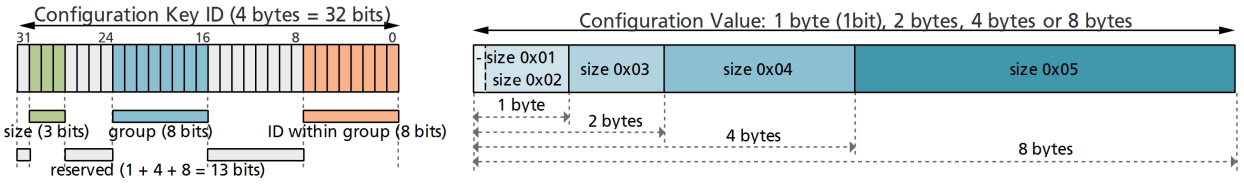
This chapter describes the Receiver Configuration Database accessible through the Configuration Interface.

6.1 Configuration Database

The configuration database in the receiver's RAM holds the current configuration, which is used by the receiver at run-time. It is constructed on startup of the receiver from several sources of configuration. These sources are called Configuration Layers. The current configuration is called the RAM Layer. Any configuration in any layer is organized as Configuration Items, where each Configuration Item is referenced by a unique Configuration Key ID and hold a single Configuration Value.

6.2 Configuration Items

The following figure shows the structure of a Configuration Item, which consists of a (Configuration) Key ID and its (Configuration) Value:



A Configuration Key ID is a 32 bit integer value, which is split into three parts (Note that bits 31, 27. .24 and 15..8 are reserved for future use and are currently unused.):

- bits 30..28: 3 bits that indicate the storage size of a Configuration Value (range 0x01-0x05, see below)
- bits 23..16: 8 bits that define a unique group ID (range 0x01-0xfe)
- bits 7..0: 8 bits that define a unique item ID within a group (range 0x01-0xfe)

The entire 32 bit value is the unique Key ID, which uniquely identifies a particular item. The numeric representation of the Key ID uses the lower-case hexadecimal format, such as `0x20c400a1`. An easier, more readable text representation uses the form CFG-GROUP-ITEM. This is also referred to as the (Configuration) Key Name.

Supported storage size identifiers (bits 30..28 of the Key ID) are:

- 0x01: one bit (the actual storage used is one byte, but only the least significant bit is used)
- 0x02: one byte
- 0x03: two bytes
- 0x04: four bytes
- 0x05: eight bytes

Each Configuration Item is of a certain type, which defines the interpretation of the raw binary data (see also number formats):

- U1, U2, U4, U8: unsigned little-endian integers of 8-, 16-, 32- and 64-bit widths
- I1, I2, I4, I8: signed little-endian, two's complement integers of 8-, 16-, 32- and 64-bit widths
- R4, R8: IEEE754 single (32-bit) and double (64-bit) precision floats
- E1, E2, E4: unsigned little-endian enumeration of 8-, 16-, and 32-bit widths (like U1, U2 and U4)

- X1, X2, X4, X8: unsigned little-endian integers of 8-, 16-, 32- and 64-bit widths for bitfields and other binary data, such as strings
- L: single-bit boolean (true = 1, false = 0), stored as U1

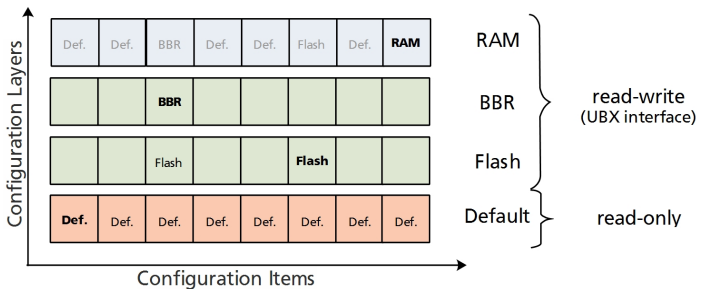
6.3 Configuration Layers

Several Configuration Layers exist. They are separate sources of Configuration Items. Some of the layers are read-only and others are modifiable. Layers are organised in terms of priority. Values in a high priority layer will replace values stored in low priority layer. On startup of the receiver all configuration layers are read and the items within each layer are stacked up in order to create the Current Configuration, which is used by the receiver at run-time.

The following configuration layers are available (in order of priority, highest priority first):

- **RAM**: This layer contains items stored in volatile RAM. This is the Current Configuration. The value of any item can be set by the user at run-time (see UBX Protocol Interface below) and it will become effective immediately.
- **BBR**: This layer contains items stored in the battery-backed RAM. The contents in this layer are preserved as long as a battery backup supply is provided during off periods. The value of any item can be set by the user at run-time (see UBX Protocol Interface below) and it will become effective upon a restart of the receiver.
- **Flash**: This layer contains items stored permanently in the external flash memory. This layer is only available if there is a usable external flash memory. The value of any item can be set by the user at run-time (see UBX Protocol Interface below) it will become effective upon a restart of the receiver.
- **Default:** This layer contains all items known to the running receiver software and their hard-coded default values. Data in this layer is not writable.

The stacking of the Configuration Items from the different layers (sources) in order to construct the Current Configuration in the RAM Layer is depicted in the following figure. For each defined item, i.e. for each item in the Default Layer, the receiver software goes through the layers above and stacks all the found items on top. Some items may not be present in every layer. The result is the RAM Layer filled with all Configuration Items given Configuration Values coming from the highest priority layer the corresponding item was present. In the example figure below bold text indicates the source of the value in the Current Configuration (the RAM Layer). Empty boxes indicate that the layer can hold the item but that it is not currently stored there. Boxes with text indicate that an item is currently stored in the layer.



In the example figure above several items (e.g. the first item) are only set in the Default Layer and hence the default value ends up in Current Configuration in the RAM Layer. The third item is present in the Default, Flash and BBR Layers. The value from the BBR Layer has the highest priority and therefore it ends up in the RAM Layer. On the other hand, the default value of the

sixth item is changed by the value in the Flash Layer. The value of the last item is changed in the RAM Layer only, i.e. upon startup the value in the RAM Layer was the value from the Default Layer, but the user has changed the value in the RAM Layer at run-time.

6.4 Configuration Interface Access

The following sections describe the existing interfaces to access the Configuration Database.

6.4.1 UBX Protocol Interface

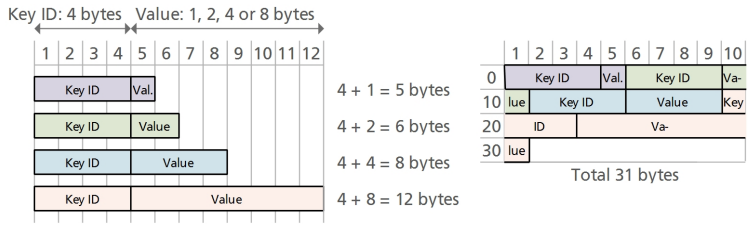
The following UBX protocol messages are available to access the Configuration Database:

- UBX-CFG-VALGET to read Configuration Items from the database
- UBX-CFG-VALSET to set Configuration Items in the database
- UBX-CFG-VALDEL to delete Configuration Items from the database

6.5 Configuration Data

Configuration data is the binary representation of a list of Key ID and Value pairs. It is formed by concatenating keys (U4 values) and values (variable type) without any padding. This format is used in the UBX-CFG-VALSET and UBX-CFG-VALGET messages.

The figure below shows an example. The four Items (Key ID - Value pairs) on the left use the four fundamental storage sizes: one byte (L, U1, I1, E1 and X1 types), 2 bytes (U2, I2, E2 and X2 types), four bytes (U4, I4, E4, X4 and R4 types) and eight bytes (U8, I8, X8 and R8 types). When concatenated (right) the Key IDs and Values are not aligned and there is no padding.



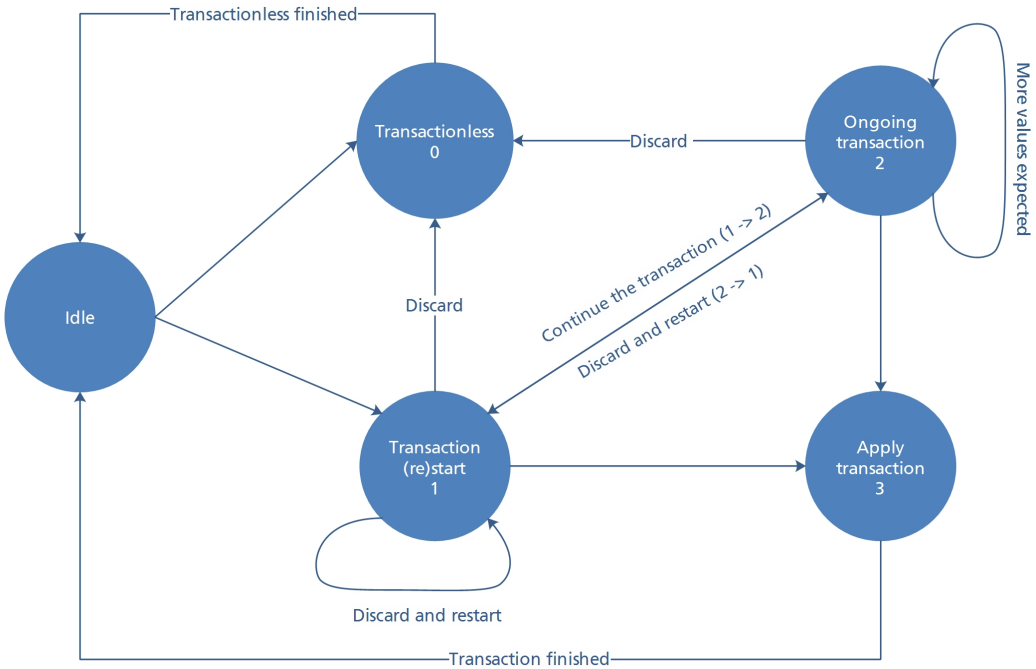
Note that this is an arbitrary example and any number of items of any value storage size can be concatenated the same way.

6.6 Configuration Transactions

The configuration concept supports two mechanisms of configuration, a transactionless mechanism where sent configuration changes are applied immediately to the configuration layer(s) requested. The second mechanism is a configuration transaction.

A transaction offers a way of queuing multiple configuration changes. It is particularly useful where different configuration keys depend on each other in such a way that sending one before the other can cause the configuration to be rejected. The queued configuration change requests are stored then checked collectively before being applied to the receiver.

A transaction can have the following states described in the figure below.



When starting a transaction, the user must specify the layer(s) the changes will be applied to. This list of configuration layer(s) must be observed throughout the transaction states, modifying the configuration layer(s) mid-transaction will cause the transaction to be aborted and no queued changes will be applied.

In the start transaction state, the receiver will lock the configuration database so that changes from another entity or message cannot be applied. It is possible to send a configuration key-value pairs with the start transaction state, and that will be queued waiting to be applied.

In the ongoing state, a configuration key and value must be sent, the receiver will abort the transaction and not apply any changes if this condition is violated, key-value pairs sent in the ongoing state will be queued waiting to be applied.

In the apply state, the queued changes will be collectively checked and applied to the requested configuration layer(s). Note that any additional key-value pairs sent within the apply state will be ignored.

Note that a transaction can only come from a single source, a UBX-CFG-VALSET message or a UBX-CFG-VALDEL message. This means that in any given transaction it is not possible to mix a delete and a save request, starting a transaction from a different source will abort the current transaction and no queued changes would be applied.

Please refer to UBX-CFG-VALSET and UBX-CFG-VALDEL messages for a detailed description of how to setup a configuration transaction, its limitations and conditions that would cause the transaction to be rejected.

6.7 Reset Behaviour

The RAM layer is always rebuilt from the layers below when the chip's processor comes out from reset. When using UBX-CFG-RST the processor goes through a reset cycle with these reset types (resetMode field):

- 0x00 hardware reset (watchdog) immediately
- 0x01 controlled software reset

- 0x04 hardware reset (watchdog) after shutdown

6.8 Configuration Reference

See Configuration Defaults for the default values.

6.8.1 CFG-GEOFENCE: Geofencing Configuration

See the chapter Geofencing in Integration manual for feature details.

If the receiver is sent a valid new configuration, it will respond with a UBX-ACK-ACK message and immediately change to the new configuration. Otherwise the receiver will reject the request, by issuing a UBX-ACK-NAK and continuing operation with the previous configuration.

Note that the acknowledge message does not indicate whether the PIO configuration has been successfully applied (pin assigned), it only indicates the successful configuration of the feature. The configured PIO must be previously unoccupied for successful assignment.

6.8.8 CFG-LOGFILTER: Data Logger Configuration

This group can be used to configure the data logger, i.e. to enable/disable the log recording and to get/set the position entry filter settings.

Position entries can be filtered based on time difference, position difference or current speed thresholds. Position and speed filtering also have a minimum time interval. A position is logged if any of the thresholds are exceeded. If a threshold is set to zero it is ignored. The maximum rate of position logging is 1Hz.

The filter settings will be configured to the provided values only if the 'applyAllFilterSettings' flag is set. This allows the recording to be enabled/disabled independently of configuring the filter settings.

It is possible to configure the data logger in the absence of a logging file. By doing so, once the logging file is created, the data logger configuration will take effect immediately and logging recording and filtering will activate according to the configuration.

CFG-LOGFILTER-* Configuration Items

Configuration Item	Key ID	Type	Scale	Unit	Description
CFG-LOGFILTER-RECORD_ENA	0x10de0002	L	-	-	Recording enabled
Set to true when recording enabled.					
CFG-LOGFILTER-ONCE_PER_WAKE_UP_ENA	0x10de0003	L	-	-	Once per wakeup
Set to true recording only one single position per PSM on/off mode wake-up period is enabled. Note: the value set here does not take effect unless CFG-LOGFILTER-APPLY_ALL_FILTERS is enabled.					
CFG-LOGFILTER-APPLY_ALL_FILTERS	0x10de0004	L	-	-	Apply all filter settings
Set to true when all filter settings are to be applied, not just recording enabling/disabling.					
CFG-LOGFILTER-MIN_INTERVAL	0x30de0005	U2	-	s	Minimum time interval between logged positions
Minimum time interval between logged positions (0 = not set). **This is only applied in combination with the speed and/or position thresholds.** If both MIN_INTERVAL and TIME_THRS are set, MIN_INTERVAL must be less than or equal to TIME_THRS. Note: the value set here does not take effect unless CFG-LOGFILTER-APPLY_ALL_FILTERS is enabled.					
CFG-LOGFILTER-TIME_THRS	0x30de0006	U2	-	s	Time threshold
If the time difference is greater than the threshold then the position is logged (0 = not set). Note: the value set here does not take effect unless CFG-LOGFILTER-APPLY_ALL_FILTERS is enabled.					
CFG-LOGFILTER-SPEED_THRS	0x30de0007	U2	-	m/s	Speed threshold
If the current speed is greater than the threshold then the position is logged (0 = not set). MIN_INTERVAL also applies. Note: value set here does not take effect unless CFG-LOGFILTER-APPLY_ALL_FILTERS is enabled.					
CFG-LOGFILTER-POSITION_THRS	0x40de0008	U4	-	m	Position threshold

6.8.9 CFG-MOT: Motion Detector Configuration

The items in this group specify the parameters used for the internal receiver motion detector. The platform motion is assessed by combining the detected motion of different detectors looking at specific data types (i.e. GNSS, gyroscopes, accelerometers, wheel-ticks). The decision thresholds of the internal detectors can be specified using the configuration items in this group.

CFG-NMEA-MAXSVS	0x20930002	E1	-	-	Maximum number of SVs to report per Talker ID
See Constants for CFG-NMEA-MAXSVS below for a list of possible constants for this item.					
CFG-NMEA-COMPAT	0x10930003	L	-	-	Enable compatibility mode
This might be needed for certain applications, e.g. for an NMEA parser that expects a fixed number of digits in position coordinates.					
CFG-NMEA-CONSIDER	0x10930004	L	-	-	Enable considering mode
This will affect NMEA output used satellite count. If set, also considered satellites (e.g. RAIMED) are counted as used satellites as well.					

CFG-NMEA-* Configuration Items continued

Configuration Item	Key ID	Type	Scale	Unit	Description
CFG-NMEA-LIMIT82	0x10930005	L	-	-	Enable strict limit to 82 characters maximum NMEA message length
CFG-NMEA-HIGHPREC	0x10930006	L	-	-	Enable high precision mode
This flag cannot be set in conjunction with either CFG-NMEA-COMPAT or CFG-NMEA-LIMIT82 Mode.					
CFG-NMEA-SVNUMBERING	0x20930007	E1	-	-	Display configuration for SVs that do not have value defined in NMEA
Configures the display of satellites that do not have an NMEA-defined value. Note: this does not apply to satellites with an unknown ID. See also Satellite Numbering. See Constants for CFG-NMEA-SVNUMBERING below for a list of possible constants for this item.					
CFG-NMEA-FILT_GPS	0x10930011	L	-	-	Disable reporting of GPS satellites

CFG-NMEA-OUT_MSKFIX	0x10930022	L	-	-	Enable position output for invalid fixes
CFG-NMEA-OUT_INVTIME	0x10930023	L	-	-	Enable time output for invalid times
CFG-NMEA-OUT_INVDATE	0x10930024	L	-	-	Enable date output for invalid dates
CFG-NMEA-OUT_ONLYGPS	0x10930025	L	-	-	Restrict output to GPS satellites only
CFG-NMEA-OUT_ FROZENCOG	0x10930026	L	-	-	Enable course over ground output even if it is frozen
CFG-NMEA-MAINTALKERID	0x20930031	E1	-	-	Main Talker ID
By default the main Talker ID (i.e. the Talker ID used for all messages other than GSV) is determined by the GNSS assignment of the receiver's channels (see CFG-SIGNAL). This field enables the main Talker ID to be overridden. See Constants for CFG-NMEA-MAINTALKERID below for a list of possible constants for this item.					
CFG-NMEA-GSVTALKERID	0x20930032	E1	-	-	Talker ID for GSV NMEA messages

CFG-NMEA-* Configuration Items continued

Configuration Item	Key ID	Type	Scale	Unit	Description
By default the Talker ID for GSV messages is GNSS specific (as defined by NMEA). This field enables the GSV Talker ID to be overridden. See Constants for CFG-NMEA-GSVTALKERID below for a list of possible constants for this item.					
CFG-NMEA-BDSTALKERID	0x30930033	U2	-	-	BeiDou Talker ID
Sets the two ASCII characters that should be used for the BeiDou Talker ID. If these are set to zero, the default BeiDou TalkerId will be used.					

Constants for CFG-NMEA-PROTVER

GB	5	Set main Talker ID to 'GB' (not available in all products)

Constants for CFG-NMEA-GSVTALKERID

Constant	Value	Description
GNSS	0	Use GNSS specific Talker ID (as defined by NMEA)
MAIN	1	Use the main Talker ID

6.8.14 CFG-ODO: Odometer and Low-Speed Course Over Ground Filter Configuration

The items in this group allow the user to configure the Odometer feature and Low-Speed Course Over Ground Filter.

CFG-ODO-* Configuration Items

Configuration Item	Key ID	Type	Scale	Unit	Description
CFG-ODO-USE_ODO	0x10220001	L	-	-	Use odometer
CFG-ODO-USE_COG	0x10220002	L	-	-	Use low-speed course over ground filter
CFG-ODO-OUTLPVEL	0x10220003	L	-	-	Output low-pass filtered velocity
CFG-ODO-OUTLPCOG	0x10220004	L	-	-	Output low-pass filtered course over ground (heading)
CFG-ODO-PROFILE	0x20220005	E1	-	-	Odometer profile configuration
See Constants for CFG-ODO-PROFILE below for a list of possible constants for this item.					
CFG-ODO-COGMAXSPEED	0x20220021	U1	-	m/s	Upper speed limit for low-speed course over ground filter
CFG-ODO-COGMAXPOSACC	0x20220022	U1	-	-	Maximum acceptable position accuracy for computing low-speed filtered course over ground
CFG-ODO-VELLPGAIN	0x20220031	U1	-	-	Velocity low-pass filter level
Range is from 0 to 255.					
CFG-ODO-COGLPGAIN	0x20220032	U1	-	-	Course over ground low-pass filter level (at speed < 8 m/s)
Range is from 0 to 255.

6.8.15 CFG-RATE: Navigation and Measurement Rate Configuration

The configuration items in this group allow the user to alter the rate at which navigation solutions (and the measurements that they depend on) are generated by the receiver. The calculation of the navigation solution will always be aligned to the top of a second zero (first second of the week) of the configured reference time system. The navigation period is an integer multiple of the measurement period.

CFG-RATE-* Configuration Items

Configuration Item	Key ID	Type	Scale	Unit	Description
CFG-RATE-MEAS	0x30210001	U2	0.001	s	Nominal time between GNSS measurements
E.g. 100ms results in 10Hz measurement rate, 1000ms = 1Hz measurement rate.					
CFG-RATE-NAV	0x30210002	U2	-	-	Ratio of number of measurements to number of navigation solutions
E.g. 5 means five measurements for every navigation solution. The maximum value is 127.					

CFG-RATE-* Configuration Items continued

Configuration Item	Key ID	Type	Scale	Unit	Description
CFG-RATE-TIMEREF	0x20210003	E1	-	-	Time system to which measurements are aligned
See Constants for CFG-RATE-TIMEREF below for a list of possible constants for this item.					

Constants for CFG-RATE-TIMEREF

Constant	Value	Description
UTC	0	Align measurements to UTC time
GPS	1	Align measurements to GPS time
GLO	2	Align measurements to GLONASS time
BDS	3	Align measurements to BeiDou time
GAL	4	Align measurements to Galileo time

6.8.16 CFG-RINV: Remote Inventory

The Remote Inventory enables storing user-defined data in the non-volatile memory of the receiver. The data can be either binary or a string of ASCII characters. In the latter case, it can optionally be output at startup after the boot screen.

CFG-RINV-* Configuration Items

Configuration Item	Key ID	Type	Scale	Unit	Description
CFG-RINV-DUMP	0x10c70001	L	-	-	Dump data at startup
When true, data will be dumped to the interface on startup, unless CFG-RINV-BINARY is set.					
CFG-RINV-BINARY	0x10c70002	L	-	-	Data is binary
When true, the data is treated as binary data.					
CFG-RINV-DATA_SIZE	0x20c70003	U1	-	-	Size of data
Size of data to store/be stored in the Remote Inventory (maximum 30 bytes).					
CFG-RINV-CHUNK0	0x50c70004	X8	-	-	Data bytes 1-8 (LSB)
Data to store/be stored in Remote Inventory - max 8 bytes, left-most in LSB, e.g. string ABCD will appear as 0x44434241.					
CFG-RINV-CHUNK1	0x50c70005	X8	-	-	Data bytes 9-16
Data to store/be stored in Remote Inventory - max 8 bytes, left-most in LSB, e.g. string ABCD will appear as 0x44434241.					
CFG-RINV-CHUNK2	0x50c70006	X8	-	-	Data bytes 17-24
Data to store/be stored in Remote Inventory - max 8 bytes, left-most in LSB, e.g. string ABCD will appear as 0x44434241.					
CFG-RINV-CHUNK3	0x50c70007	X8	-	-	Data bytes 25-30 (MSB)
Data to store/be stored in Remote Inventory - max 6 bytes, left-most in LSB, e.g. string ABCD will appear as 0x44434241.					

6.8.17 CFG-SIGNAL: Satellite Systems (GNSS) Signal Configuration

It is necessary for at least one signal and constellation from a major GNSS to be enabled, after applying the new configuration to the current one.

The individual signals enable keys are governed by their corresponding constellation enable key. See GNSS Signal Configuration for more details.

Configuration specific to a GNSS system can be done via other groups (e.g. **CFG-SBAS-***).

Note that changes to any items within this group will trigger a reset to the GNSS subsystem.

CFG-SIGNAL-* Configuration Items

CFG-SPIOUTPROT-RTCM3X	0x107a0004	L	-	-	Flag to indicate if RTCM3X should be an output protocol on SPI

6.8.21 CFG-TMODE: Time Mode Configuration

Configuration for operation of the receiver in Time Mode. The position referred to in the configuration items is that of the Antenna Reference Point (ARP).

CFG-TMODE-* Configuration Items

Configuration Item	Key ID	Type	Scale	Unit	Description
CFG-TMODE-MODE	0x20030001	E1	-	-	Receiver mode
See Constants for CFG-TMODE-MODE below for a list of possible constants for this item.					
CFG-TMODE-POS_TYPE	0x20030002	E1	-	-	Determines whether the ARP position is given in ECEF or LAT/LON/HEIGHT?
See Constants for CFG-TMODE-POS_TYPE below for a list of possible constants for this item.					

CFG-TMODE-* Configuration Items continued

Configuration Item	Key ID	Type	Scale	Unit	Description
CFG-TMODE-ECEF_X	0x40030003	I4	-	cm	ECEF X coordinate of the ARP position.
This will only be used if CFG-TMODE-MODE=FIXED and CFG-TMODE-POS_TYPE=ECEF.					
CFG-TMODE-ECEF_Y	0x40030004	I4	-	cm	ECEF Y coordinate of the ARP position.
This will only be used if CFG-TMODE-MODE=FIXED and CFG-TMODE-POS_TYPE=ECEF.					
CFG-TMODE-ECEF_Z	0x40030005	I4	-	cm	ECEF Z coordinate of the ARP position.
This will only be used if CFG-TMODE-MODE=FIXED and CFG-TMODE-POS_TYPE=ECEF.					
CFG-TMODE-ECEF_X_HP	0x20030006	I1	0.1	mm	High-precision ECEF X coordinate of the ARP position.

CFG-TMODE-ECEF_Z_HP	0x20030008	I1	0.1	mm	High-precision ECEF Z coordinate of the ARP position.
Accepted range is -99 to +99. This will only be used if CFG-TMODE-MODE=FIXED and CFG-TMODE-POS_TYPE=ECEF.					
CFG-TMODE-LAT	0x40030009	I4	1e-7	deg	Latitude of the ARP position.
This will only be used if CFG-TMODE-MODE=FIXED and CFG-TMODE-POS_TYPE=LLH.					
CFG-TMODE-LON	0x4003000a	I4	1e-7	deg	Longitude of the ARP position.
This will only be used if CFG-TMODE-MODE=FIXED and CFG-TMODE-POS_TYPE=LLH.					
CFG-TMODE-HEIGHT	0x4003000b	I4	-	cm	Height of the ARP position.
This will only be used if CFG-TMODE-MODE=FIXED and CFG-TMODE-POS_TYPE=LLH.					
CFG-TMODE-LAT_HP	0x2003000c	I1	1e-9	deg	High-precision latitude of the ARP position
Accepted range is -99 to +99. This will only be used if CFG-TMODE-MODE=FIXED and CFG-TMODE-POS_TYPE=LLH.					
CFG-TMODE-LON_HP	0x2003000d	I1	1e-9	deg	High-precision longitude of the ARP position.
Accepted range is -99 to +99. This will only be used if CFG-TMODE-MODE=FIXED and CFG-TMODE-POS_TYPE=LLH.					
CFG-TMODE-HEIGHT_HP	0x2003000e	I1	0.1	mm	High-precision height of the ARP position.
Accepted range is -99 to +99. This will only be used if CFG-TMODE-MODE=FIXED and CFG-TMODE-POS_TYPE=LLH.					
CFG-TMODE-FIXED_POS_ACC	0x4003000f	U4	0.1	mm	Fixed position 3D accuracy
CFG-TMODE-SVIN_MIN_DUR	0x40030010	U4	-	s	Survey-in minimum duration
This will only be used if CFG-TMODE-MODE=SURVEY_IN.					
CFG-TMODE-SVIN_ACC_LIMIT	0x40030011	U4	0.1	mm	Survey-in position accuracy limit
This will only be used if CFG-TMODE-MODE=SURVEY_IN.					

Constants for CFG-TMODE-MODE

Constant	Value	Description
DISABLED	0	Disabled
SURVEY_IN	1	Survey In
FIXED	2	Fixed Mode (true ARP position information required)

Constants for CFG-TMODE-POS_TYPE

Constant	Value	Description
ECEF	0	Position is ECEF
LLH	1	Position is Lat/Lon/Height

6.8.22 CFG-TP: Timepulse Configuration

Use this group to configure the generation of timepulses.

CFG-TP-* Configuration Items

Configuration Item	Key ID	Type	Scale	Unit	Description
CFG-TP-PULSE_DEF	0x20050023	E1	-	-	Determines whether the time pulse is interpreted as frequency or period?
See Constants for CFG-TP-PULSE_DEF below for a list of possible constants for this item.					
CFG-TP-PULSE_LENGTH_DEF	0x20050030	E1	-	-	Determines whether the time pulse length is interpreted as length[us] or pulse ratio[%]?
See Constants for CFG-TP-PULSE_LENGTH_DEF below for a list of possible constants for this item.					
CFG-TP-ANT_CABLEDELAY	0x30050001	I2	0.0000000001	s	Antenna cable delay
CFG-TP-PERIOD_TP1	0x40050002	U4	0.000001	s	Time pulse period (TP1)
CFG-TP-PERIOD_LOCK_TP1	0x40050003	U4	0.000001	s	Time pulse period when locked to GNSS time (TP1)
Only used if CFG-TP-USE_LOCKED_TP1 is set.					
CFG-TP-FREQ_TP1	0x40050024	U4	-	Hz	Time pulse frequency (TP1)
This will only be used if CFG-TP-PULSE_DEF=FREQ.					
CFG-TP-FREQ_LOCK_TP1	0x40050025	U4	-	Hz	Time pulse frequency when locked to GNSS time (TP1)
Only used if CFG-TP-USE_LOCKED_TP1 is set.					
CFG-TP-LEN_TP1	0x40050004	U4	0.000001	s	Time pulse length (TP1)

CFG-TP-* Configuration Items continued

Configuration Item	Key ID	Type	Scale	Unit	Description
CFG-TP-LEN_LOCK_TP1	0x40050005	U4	0.000001	s	Time pulse length when locked to GNSS time (TP1)
Only used if CFG-TP-USE_LOCKED_TP1 is set.					
CFG-TP-DUTY_TP1	0x5005002a	R8	-	%	Time pulse duty cycle (TP1)
Only used if CFG-TP-PULSE_LENGTH_DEF=RATIO is set.					
CFG-TP-DUTY_LOCK_TP1	0x5005002b	R8	-	%	Time pulse duty cycle when locked to GNSS time (TP1)
Only used if CFG-TP-PULSE_LENGTH_DEF=RATIO and CFG-TP-USE_LOCKED_TP1 are set.					
CFG-TP-USER_DELAY_TP1	0x40050006	I4	0.000000001	s	User configurable time pulse delay (TP1)
CFG-TP-TP1_ENA	0x10050007	L	-	-	Enable the first timepulse
if pin associated with time pulse is assigned for another function, the other function takes precedence. Must be set for frequency-time products.					
CFG-TP-SYNC_GNSS_TP1	0x10050008	L	-	-	Sync time pulse to GNSS time or local clock (TP1)
If set, sync to GNSS if GNSS time is valid otherwise, if not set or not available, use local clock. Ignored by time-frequency product varients, which will attempt to use the best available time/frequency reference (not necessarily GNSS).					
CFG-TP-USE_LOCKED_TP1	0x10050009	L	-	-	Use locked parameters when possible (TP1)
If set, use CFG-TP-PERIOD_LOCK_TP1 and CFG-TP-LEN_LOCK_TP1 as soon as GNSS time is valid, otherwise if not valid or not set, use CFG-TP-PERIOD_TP1 and CFG-TP-LEN_TP1.					
CFG-TP-ALIGN_TO_TOW_TP1	0x1005000a	L	-	-	Align time pulse to top of second (TP1)
To use this feature, CFG-TP-USE_LOCKED_TP1 must be set. Time pulse period must be an integer fraction of 1 second. Ignored in time-frequency product varients,where it is assumed always enabled.					
CFG-TP-POL_TP1	0x1005000b	L	-	-	Set time pulse polarity (TP1)
false (0) : falling edge at top of second. true (1) : rising edge at top of second.					
CFG-TP-TIMEGRID_TP1	0x2005000c	E1	-	-	Time grid to use (TP1)
Only relevent if CFG-TP-USE_LOCKED_TP1 and ALIGN_TO_TOW_TP1 are set. Note that configured GNSS time is estimated by the receiver if locked to any GNSS system. If the receiver has a valid GNSS fix it will attempt to steer the TP to the specified time grid even if the specified time is not based on information from the constellation's satellites. To ensure timing based purely on a given GNSS, restrict the supported constellations in CFG-SIGNAL-*. See Constants for CFG-TP-TIMEGRID_TP1 below for a list of possible constants for this item.

7.1.2 u-blox Proprietary RTCM Messages

The RTCM message type 4072 is the u-blox proprietary RTCM message. It is supported by the RTCM standard version 3.2 and above.

7.1.2.1 Sub-Types

There are different available sub-types of the RTCM message type 4072. The table below shows the available RTCM 4072 sub-types.

RTCM 4072 Sub-Types

Sub-Type	Message Type Number	Sub-Type Number	Description	Message Data (Payload) Length (bits)
0	0xFE8	0x000	Reference station PVT	1008+48
1	0xFE8	0x001	Additional reference station information	112+48*(2*N) (N = the number of enabled GNSS constellations)

7.1.3 Configuration

The configuration of the RTK rover and reference station is explained in the Integration Manual.

The RTCM3 protocol can be disabled/enabled on communication interfaces by means of the configuration items, for example CFG-UART1OUTPROT-RTCM3X.

7.1.4 Reference

The RTCM3 support is implemented according to RTCM STANDARD 10403.3 DIFFERENTIAL GNSS (GLOBAL NAVIGATION SATELLITE SYSTEMS) SERVICES - VERSION 3.

Appendix

A Satellite Numbering

A summary of all the SV numbering schemes is provided in the following table.

Satellite numbering

GNSS Type	SV range	UBX gnssId: svId	UBX svId	NMEA 2.X-4.0 (strict)	NMEA 2.X-4.0 (extended)	NMEA 4.10+ (strict)	NMEA 4.10+ (extended)
GPS	G1-G32	0:1-32	1-32	1-32	1-32	1-32	1-32
SBAS	S120-S158	1:120-158	120-158	33-64	33-64,152-158	33-64	33-64,152-158
Galileo	E1-E36	2:1-36	211-246	-	301-336	1-36	1-36
BeiDou	B1-B37	3:1-37	159-163,33-64	-	401-437	1-37	1-37
QZSS	Q1-Q10	5:1-10	193-202	-	193-202	-	193-202
GLONASS	R1-R32, R?	6:1-32, 6: 255	65-96, 255	65-96, null	65-96, null	65-96, null	65-96, null

B UBX and NMEA Signal Identifiers

UBX and NMEA protocols use signal identifiers (commonly abbreviated to "sigId") to distinguish between different signals from GNSS.

Signal identifiers are only valid when combined with a GNSS identifier (see above). The table below shows the range of identifiers currently supported in the firmware.

The following table shows the mapping of GNSS signals to UBX / NMEA signal identifier.

Signal Identifiers

Signal name	UBX gnssId	UBX sigId	NMEA 4.10+ gnssId	NMEA 4.10+ sigId
GPS L1C/A*	0	0	1	1
GPS L2 CL	0	3	1	6
GPS L2 CM	0	4	1	5
Galileo E1 C*	2	0	3	7
Galileo E1 B*	2	1	3	7
Galileo E5 bI	2	5	3	2
Galileo E5 bQ	2	6	3	2
BeiDou B1I D1*	3	0	4**	1**
BeiDou B1I D2*	3	1	4**	1**
BeiDou B2I D1	3	2	4**	3**
BeiDou B2I D2	3	3	4**	3**
QZSS L1C/A*	5	0		
QZSS L2 CM	5	4		
QZSS L2 CL	5	5		
GLONASS L1 OF*	6	0	2	1
GLONASS L2 OF	6	2	2	3

UBX messages, that don't have an explicit sigId field, contain information about the subset of signals marked with (*).

BeiDou gnssId and sigId are not defined in the NMEA protocol version 4.10, values shown in the table are valid for u-blox products only (**).

C Configuration Defaults

The configuration defaults given in this section apply to the receiver firmwares given below.

Overview

As part of our commitment to customer support, u-blox maintains an extensive volume of technical documentation for our products. In addition to product-specific data sheets and integration manuals, general documents are also available. These include:

- GPS Compendium, Docu. No GPS-X-02007
- GPS Antennas - RF Design Considerations for u-blox GPS Receivers, Docu. No GPS-X-08014

Our website www.u-blox.com is a valuable resource for general and product specific documentation.
