

u-blox ZED-F9P

Interface Description

Abstract

The Interface Description describes the UBX (version 27. 11), NMEA and RTCM protocols and serves as a reference manual for the u-blox ZED-F9P high precision positioning receiver.

Document Information			
Title	u-blox ZED-F9P Interface Description		
Subtitle	v27.11		
Document type	Manual		
Document number	UBX-18010854		
Revision and date	R07 (6e984c3)	10 July 2019	
Document status	Early Production Information		

Document status explanation		
Objective Specification	Document contains target values. Revised and supplementary data will be published later.	
Advance Information	Document contains data based on early testing. Revised and supplementary data will be published later.	
Early Production Information	Document contains data from product verification. Revised and supplementary data may be published later.	
Production Information	Document contains the final product specification.	

u-blox reserves all rights to this document and the information contained herein. Preface

1 Document Overview

The Interface Description is a reference describing the messages used by the u-blox receiver and is organized by the specific NMEA, UBX, and RTCM messages.

2 Firmware and Protocol Versions

The protocol version defines a set of messages that are applicable across various u-blox products. Each firmware used by a u-blox receiver supports a specific protocol version, which is not configurable.

The following sections will explain how to decode the shown information to get the firmware and the protocol version.

2.1 How to Determine the Version and the Location of the Firmware

The u-blox receiver contains a firmware in two different locations:

- Internal ROM
- · External Flash memory

The location and the version of the currently running firmware can be found in the boot screen or in the UBX-MON-VER message.

2.1.1 Decoding the Boot Screen (for Protocol Version 24 and Above)

Boot screen for a u-blox receiver running from Flash:

```

```

Possible lines in the boot screen and their meanings:

Entry	Description
u-blox AG - www.u-blox.com	Start of the boot screen
HW UBX 9 00190000	Hardware version of the u-blox receiver (u-blox 9 receiver)
EXT CORE 1.00 (61b2dd)	Firmware version 1.00 downloaded from Flash (revision
	number)
ROM BASE	Underlying firmware version in ROM (revision number)

Possible lines in the boot screen and their meanings: continued

Entry	Description
FWVER=HPG 1.12	Firmware of product category and version where
	SPG: Firmware of Standard Precision GNSS product
	HPG: Firmware of High Precision GNSS product
	ADR: Firmware of ADR product
	UDR: Firmware of UDR product
	TIM: Firmware of Time Sync product
	FTS: Firmware of Time & Frequency Sync product
	LAP: Firmware of Lane Accurate product
PROTVER=27.11	Supported protocol version
GPS;GLO;GAL;BDS	Supported major GNSS.
SBAS; IMES; QZSS	Supported augmentation systems.
ANTSUPERV=AC SD PDoS SR	Configuration of the Antenna supervisor where
	AC: Active Antenna Control enabled
	SD: Short Circuit Detection enabled
	OD: Open Circuit Detection enabled
	PDoS: Short Circuit Power Down Logic enabled
	SR: Automatic Recovery from Short state
PF=FFF79	Product configuration.

The line containing the FWVER indicates which version of the firmware is currently running and is called **firmware version** in the rest of the document.

The numbers in parentheses (revision numbers) should only be used to identify a known firmware version and are not guaranteed to increase over time.

2.1.2 Decoding the output of UBX-MON-VER (for Protocol Version 24 and above)

Software Version	
EXT CORE 1.00 (61b2d	id)
Hardware Version	
00190000	
Extension(s)	
ROM BASE 0x118B206 FWVER=HPG 1.12 PROTVER=27.11 MOD=ZED-F9P GPS;GLO;GAL;BDS QZSS	60

Possible fields in UBX-MON-VER and their meanings:

Entry	Description
Software Version	Currently running firmware version.
EXT CORE 1.00 (61b2dd)	If ROM CORE, then the u-blox receiver runs from ROM .
	If EXT CORE, then the u-blox receiver runs a firmware
	downloaded from Flash .
Hardware Version	The hardware version of the u-blox receiver.
Extension(s)	Extended information about the u-blox receiver firmware. See
	table below for the entries.

Not every entry is output by every u-blox receiver in the UBX-MON-VER extensions. This depends on the product, the firmware location and the firmware version.

Possible entries in UBX-MON-VER Extension(s):

Entry	Description
ROM BASE	Underlying firmware version in ROM.
	If such an entry is present, then the u-blox receiver runs a
	firmware downloaded from Flash .
FWVER=HPG 1.12	Firmware of product category and version where
	SPG: Firmware of Standard Precision GNSS product
	HPG: Firmware of High Precision GNSS product
	ADR: Firmware of ADR product
	UDR: Firmware of UDR product
	TIM: Firmware of Time Sync product
	FTS: Firmware of Time & Frequency Sync product
	LAP: Firmware of Lane Accurate product
PROTVER=27.11	Supported protocol version.
MOD=ZED-F9P	Module identification. Set in production.
GPS;GLO;GAL;BDS	Supported major GNSS.
SBAS; IMES; QZSS	Supported augmentation systems.

2.2 How to Determine the Supported Protocol Version of the u-blox Receiver

Each u-blox receiver reports its supported protocol version in the following ways:

- On start-up in the boot screen
- In the UBX-MON-VER message

with the line containing PROTVER (example: PROTVER=27.11).

Additionally, the firmware string, together with the firmware version, can be used to look up the corresponding protocol version. The tables below give an overview of the released firmware and their corresponding protocol versions.

2.2.1 u-blox 9 Firmware and Supported Protocol Versions

Firmware for High Precision GNSS Products

Firmware version	Firmware string	Protocol Version
HPG 1.00	EXT CORE 1.00 (61ce84)	27.00
HPG 1.10	EXT CORE 1.00 (eba0dc)	27.10
HPG 1.11	EXT CORE 1.00 (94e56e)	27.10

Firmware for High Precision GNSS Products continued

Firmware version	Firmware string	Protocol Version	
HPG 1.12	EXT CORE 1.00 (61b2dd)	27.11	

3 Receiver Configuration

u-blox positioning receivers are fully configurable with UBX protocol messages. The configuration used by the receiver during normal operation is called the "current configuration". The current configuration can be changed during normal operation by sending UBX-CFG-VALSET messages over any I/O port (except UART2). The receiver will change its current configuration immediately after receiving a configuration message. The receiver will always use the current configuration only.

The current configuration is loaded from permanent configuration hard-coded in the receiver firmware (the defaults) and from non-volatile memory (user configuration) on startup of the receiver. Changes made to the current configuration at run-time will be lost when there is a power cycle, a hardware reset or a (complete) controlled software reset (see chapter Forcing a Receiver Reset in the Integration Manual).

See the Configuration Interface section for a detailed description of the receiver configuration system, the explanation of the configuration concept and its principles and interfaces.

The configuration interface has changed from earlier u-blox positioning receivers. There is some backwards compatibility. Users are strongly advised to only use the **Configuration Interface** referred to in the following sections. See also **Legacy Configuration Interface Compatibility**.

See the Integration Manual for a basic receiver configuration most commonly used.

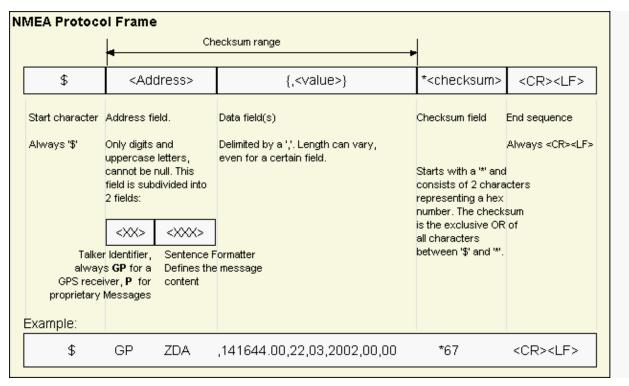

Interface Description

4 NMEA Protocol

4.1 Protocol Overview

4.1.1 Message Format

NMEA messages sent by the GNSS receiver are based on NMEA 0183 Version 4.10. The following picture shows the structure of a NMEA protocol message.

For further information on the NMEA Standard, refer to NMEA 0183 Standard For Interfacing Marine Electronic Devices, Version 4.10, June, 2012. See http://www.nmea.org/ for ordering instructions.

The NMEA standard allows for proprietary, manufacturer-specific messages to be added. These shall be marked with a manufacturer mnemonic. The mnemonic assigned to u-blox is UBX and is used for all non-standard messages. These proprietary NMEA messages therefore have the address field set to PUBX. The first data field in a PUBX message identifies the message number with two digits.

4.1.2 Talker ID

One of the ways the NMEA standard differentiates between GNSS is by using a two-letter message identifier, the 'Talker ID'. The specific Talker ID used by a u-blox receiver will depend on the device model and system configuration. The table below shows the Talker ID that will be used for various GNSS configurations.

NMEA Talker IDs

Configured GNSS	Talker ID
GPS, SBAS, QZSS	GP
GLONASS	GL
Galileo	GA
BeiDou	GB*
Any combination of GNSS	GN

^{*}This is a u-blox extension to the NMEA 4.10 standard. Only NMEA 4.11 defines the GB talker ID. See also Extended Configuration in Protocol Configuration.

4.1.3 Protocol Configuration

The NMEA protocol on u-blox receivers can be configured to the need of customer applications using configuration items CFG-NMEA-*.

There are four NMEA standards supported. The default NMEA version is 4.10. Alternatively versions 4.00, 2.3, and 2.1 can be enabled (for details on how this affects the output refer to section Position Fix Flags in NMEA Mode).

NMEA defines satellite numbering systems for some, but not all GNSS (this is partly dependent on the NMEA version). Satellite numbers for unsupported GNSS can be configured using configuration items CFG-NMEA-*. Unknown satellite numbers are always reported as a null NMEA field (i.e. an empty string).

The NMEA specification indicates that the GGA message is GPS specific. However, u-blox receivers support the output of a GGA message for each of the Talker IDs.

NMEA filtering flags

Parameter	Description
Position filtering	Enable positions from failed or invalid fixes to be reported (with the "V" status
	flag to indicate that the data is not valid).
Valid position	Enable positions from invalid fixes to be reported (with the "V" status flag to
filtering	indicate that the data is not valid).
Time filtering	Enable the receiver's best knowledge of time to be output, even though it
	might be wrong.
Date filtering	Enable the receiver's best knowledge of date to be output, even though it
	might be wrong.
GPS-only filtering	Restrict output to GPS satellites only.
Track filtering	Permit course over ground (COG) to be reported even when it would otherwise
	be frozen.

NMEA flags

Parameter	Description
Compatibility	Some older NMEA applications expect the NMEA output to be formatted in a
Mode	specific way, for example, they will only work if the latitude and longitude have
	exactly four digits behind the decimal point. u-blox receivers offer a
	compatibility mode to support these legacy applications.

NMEA flags continued

Parameter	Description
Consideration	u-blox receivers use a sophisticated signal quality detection scheme, in order
Mode	to produce the best possible position output. This algorithm considers all SV
	measurements, and may eventually decide to only use a subset thereof, if it
	improves the overall position accuracy. If Consideration mode is enabled, all
	satellites, which were considered for navigation, are communicated as being
	used for the position determination. If Consideration Mode is disabled, only
	those satellites which after the consideration step remained in the position
	output are marked as being used.
Limit82 Mode	Enabling this mode will limit the NMEA sentence length to a maximum of 82
	characters.
High Precision	Enabling this mode increases precision of the position output. Latitude and
Mode	longitude then have seven digits after the decimal point, and altitude has
	three digits after the decimal point. Note: The High Precision Mode cannot be
	set in conjunction with either Compatibility Mode or Limit82 Mode.

Extended configuration

Option	Description
GNSS to filter	Filters satellites based on their GNSS
Satellite	This field configures the display of satellites that do not have an NMEA-
numbering	defined value. Note: this does not apply to satellites with an unknown ID.
Main Talker ID	By default the main Talker ID (i.e. the Talker ID used for all messages other
	than GSV) is determined by the GNSS assignment of the receiver's channels
	(see configuration items CFG-SIGNAL-*). This field enables the main Talker
	ID to be overridden.
GSV Talker ID	By default the Talker ID for GSV messages is GNSS specific (as defined by
	NMEA). This field enables the GSV Talker ID to be overridden.
BDS Talker ID	By default the Talker ID for BeiDou is 'GB'. This field enables the BeiDou Talker
	ID to be overridden.

Extra fields in NMEA 4.10 and above

Message	Extra fields
GBS	systemId, signalId
GNS	navStatus
GRS	systemId, signalId
GSA	systemId
GSV	signalld
RMC	navStatus

4.1.4 Satellite Numbering

The NMEA protocol (V4.10) identifies GNSS satellites with a one digit system ID and a two digit satellite number. u-blox receivers support this method in their NMEA output when "strict" SV numbering is selected.

In most cases this is the default setting, but can be checked or set using configuration items CFG-NMEA-*.

In order to support QZSS within current receivers and prepare for support of other systems (e.g.

Galileo) in future receivers, an "extended" SV numbering scheme can be enabled (using configuration items CFG-NMEA-*).

This uses the NMEA-defined numbers where possible, but adds other number ranges to support other GNSS. Note however that these non-standard extensions require 3 digit numbers, which may not be supported by some NMEA parsing software. For example QZSS satellites are reported using numbers in the range 193 to 197.

See Satellite Numbering for a complete list of satellite numbers.

GLONASS satellites can be tracked before they have been identified. In NMEA output, such unknown satellite numbers are always reported as a null field (i.e. an empty string).

4.1.5 Latitude and Longitude Format

According to the NMEA Standard, Latitude and Longitude are output in the format Degrees, Minutes and (Decimal) Fractions of Minutes. To convert to Degrees and Fractions of Degrees, or Degrees, Minutes, Seconds and Fractions of seconds, the 'Minutes' and 'Fractional Minutes' parts need to be converted. In other words: If the GPS Receiver reports a Latitude of 4717.112671 North and Longitude of 00833.914843 East, this is

Latitude 47 Degrees, 17.112671 Minutes

Longitude 8 Degrees, 33.914843 Minutes

Latitude 47 Degrees, 17 Minutes, 6.76026 Seconds Longitude 8 Degrees, 33 Minutes, 54.89058 Seconds

Latitude 47.28521118 Degrees

Longitude 8.56524738 Degrees

4.1.6 Position Fix Flags

This section shows how u-blox implements the NMEA protocol and the conditions determining how flags are set.

Flags in NMEA 4.10 and above

NMEA Message	GLL, RMC	GGA	GLL, VTG	RMC, GNS
Field	status	quality	posMode	posMode
No position fix (at power-up, after losing satellite lock)	V	0	N	N
GNSS fix, but user limits exceeded	V	0	N	N
Dead reckoning fix, but user limits exceeded	V	6	E	E
Dead reckoning fix	А	6	Е	Е
RTK float	А	5	D	F
RTK fixed	А	4	D	R
2D GNSS fix	Α	1/2	A/D	A/D
3D GNSS fix	Α	1/2	A/D	A/D
Combined GNSS/dead reckoning fix	А	1/2	A/D	A/D
	See below (1)	See below	See below	See below
		(2)	(3)	(3)

⁽¹⁾ Possible values for status: V = Data invalid, A = Data valid

(2) Possible values for quality: 0 = No fix, 1 = Autonomous GNSS fix, 2 = Differential GNSS fix, 4 =

RTK fixed, 5 = RTK float, 6 = Estimated/Dead reckoning fix

(3) Possible values for posMode: N = No fix, E = Estimated/Dead reckoning fix, A = Autonomous GNSS fix, D = Differential GNSS fix, F = RTK float, R = RTK fixed

Flags in NMEA 2.3 and above

NMEA Message	GLL, RMC	GGA	GSA	GLL, VTG,
				RMC, GNS
Field	status	quality	navMode	posMode
No position fix (at power-up, after losing satellite lock)	V	0	1	N
GNSS fix, but user limits exceeded	V	0	1	N
Dead reckoning fix, but user limits exceeded	V	6	2	Е
Dead reckoning fix	А	6	2	Е
2D GNSS fix	А	1/2	2	A/D
3D GNSS fix	А	1/2	3	A/D
Combined GNSS/dead reckoning fix	Α	1/2	3	A/D
	See below (1)	See below	See below	See below
		(2)	(3)	(4)

- (1) Possible values for status: V = Data invalid, A = Data valid
- (2) Possible values for quality: 0 = No fix, 1 = Autonomous GNSS fix, 2 = Differential GNSS fix, 4 = RTK fixed, 5 = RTK float, 6 = Estimated/Dead reckoning fix
- (3) Possible values for navMode: 1 = No fix, 2 = 2D fix, 3 = 3D fix
- (4) Possible values for posMode: N = No fix, E = Estimated/Dead reckoning fix, A = Autonomous GNSS fix, D = Differential GNSS fix, F = RTK float, R = RTK fixed

Flags in NMEA 2.1 and below

The flags in NMEA 2.1 and below are the same as NMEA 2.3 and above but with the following differences:

- The posMode field is not output for GLL, RMC and VTG messages (each message has one field less).
- The GGA quality field is set to 1 (instead of 6) for both types of dead reckoning fix.

4.1.7 Multi-GNSS Considerations

Many applications which process NMEA messages assume that only a single GNSS is active. However, when multiple GNSS are configured, the NMEA specification requires the output to change in the following ways:

NMEA output for Multi-GNSS

Change	Description
Main Talker ID	The main Talker ID will be 'GN' (e.g. instead of 'GP' for a GPS receiver)
GSV Talker IDs	The GSV message reports the signal strength of the visible
	satellites. However, the Talker ID it uses is specific to the GNSS it is
	reporting information for, so for a multi-GNSS receiver it will not be
	the same as the main Talker ID. (e.g. other messages will be using
	the 'GN' Talker ID but the GSV message will use GNSS-specific
	Talker IDs)

NMEA output for Multi-GNSS continued

Change	Description
Multiple GSA and GRS	Multiple GSA and GRS messages are output for each fix, one for
Messages	each GNSS. This may confuse applications which assume they are
	output only once per position fix (as is the case for a single GNSS
	receiver).

4.1.8 Output of Invalid/Unknown Data

By default the receiver will not output invalid data. In such cases, it will output empty fields.

A valid position fix is reported as follows:

\$GPGLL,4717.11634,N,00833.91297,E,124923.00,A,A*6E

An invalid position fix (but time valid) is reported as follows:

\$GPGLL,,,,,124924.00,V,N*42

If Time is unknown (e.g. during a cold-start):

\$GPGLL,,,,,,V,N*64

Note:

Output of invalid data marked with the 'Invalid/Valid' Flags can be enabled using the configuration items CFG-NMEA-*.

4.1.9 Messages Overview

When configuring NMEA messages using the configuration items CFG-NMEA-*), the Class/lds shown in the table shall be used.

Page	Mnemonic	Cls/ID	Description	
	NMEA Standard Messages		Standard Messages

Message	GBS	GBS					
Description	GNSS Satellit	GNSS Satellite Fault Detection					
Firmware	Supported on:						
	• u-blox 9 with	n protocol vers	ion 27.11				
Туре	Output						
Comment	This message outputs the results of the Receiver Autonomous Integrity Monitoring Algorithm (RAIM). • The fields errLat, errLon and errAlt output the standard deviation of the position calculation, using all satellites which pass the RAIM test successfully. • The fields errLat, errLon and errAlt are only output if the RAIM process passed successfully (i.e. no or successful edits happened). These fields are never output if 4 or fewer satellites are used for the navigation calculation (because, in such cases, integrity can not be determined by the receiver autonomously). • The fields prob, bias and stdev are only output if at least one satellite failed in the RAIM test. If more than one satellites fail the RAIM test, only the information for the worst						
		put in this mes					
	ID for CFG-MSG	Number of fields

5 UBX Protocol

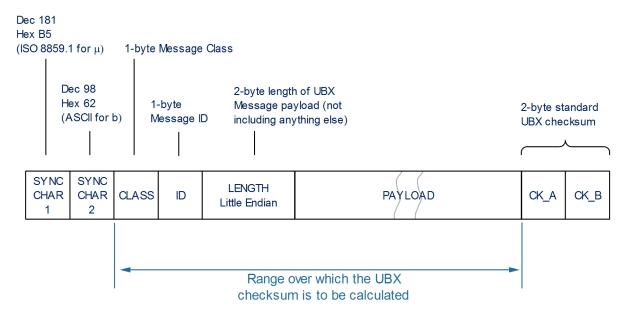

5.1 UBX Protocol Key Features

u-blox receivers support a u-blox proprietary protocol to communicate with a host computer. This protocol has the following key features:

- Compact uses 8-bit Binary Data.
- Checksum Protected uses a low-overhead checksum algorithm
- Modular uses a 2-stage message identifier (Class and Message ID)

5.2 UBX Frame Structure

The structure of a basic UBX Frame is shown in the following diagram.

- Every **Frame** starts with a 2-byte Preamble consisting of two synchronization characters: 0xB5 0x62.
- A 1-byte Message Class field follows. A Class is a group of messages that are related to each other.
- A 1-byte Message ID field defines the message that is to follow.
- A 2-byte **Length** field follows. The length is defined as being that of the payload only. It does not include the Preamble, Message Class, Message ID, Length, or CRC fields. The number format of the length field is a Little-Endian unsigned 16-bit integer.
- The **Payload** field contains a variable number of bytes.
- The two 1-byte **CK_A** and **CK_B** fields hold a 16-bit checksum whose calculation is defined below. This concludes the Frame.

5.3 UBX Payload Definition Rules

5.3.1 Structure Packing

Values are placed in an order that structure packing is not a problem. This means that 2-byte values shall start on offsets which are a multiple of 2; 4-byte values shall start at a multiple of 4; and so on.

5.3.2 Reserved Elements

Some messages contain reserved fields or bits to allow for future expansion. The contents of these elements should be ignored in output messages and must be set to zero in input messages. Where a message is output and subsequently returned to the receiver as input message, reserved elements can either be explicitly set to zero or left with whatever value they were output with.

5.3.3 Undefined Values

The description of some fields provide specific meanings for specific values. For example, the field gnssld appears in many UBX messages and uses 0 to indicate GPS, 1 for SBAS and so on (see Satellite Numbering for details); however it is usually stored in a byte with far more possible values than the handful currently defined. All such undefined values are reserved for future expansion and therefore should not be used.

5.3.4 Message Naming

Referring to messages is done by adding the class name and a dash in front of the message name. For example, the version information message is referred to as <code>UBX-MON-VER</code>. Referring to message fields or their values is done by adding a dot and the name, e.g. <code>UBX-MON-VER</code>. swVersion.

5.3.5 Number Formats

All multi-byte values are ordered in Little Endian format, unless otherwise indicated.

All floating point values are transmitted in IEEE754 single or double precision.

Variable Type Definitions

Short	Туре	Size	Comment	Min/Max	Resolution
		(Bytes)			
U1	Unsigned Char	1		0255	1

				2^+1023	
СН	ASCII / ISO 8859.1	1			
	Encoding				

5.4 UBX Checksum

The checksum is calculated over the Message, starting and including the CLASS field, up until, but excluding, the Checksum Field:

The checksum algorithm used is the 8-Bit Fletcher Algorithm, which is used in the TCP standard (RFC 1145). This algorithm works as follows:

- Buffer[N] contains the data over which the checksum is to be calculated.
- The two CK_ values are 8-Bit unsigned integers, only! If implementing with larger-sized integer values, make sure to mask both CK_A and CK_B with 0xFF after both operations in the loop.

```
CK_A = 0, CK_B = 0
For(I=0;I<N;I++)
{
    CK_A = CK_A + Buffer[I]
    CK_B = CK_B + CK_A
}</pre>
```

 After the loop, the two U1 values contain the checksum, transmitted after the Message, which conclude the Frame.

5.5 UBX Message Flow

There are certain features associated with the messages being sent back and forth:

5.5.1 Acknowledgement

When messages from the class CFG are sent to the receiver, the receiver will send an "acknowledge" (UBX-ACK-ACK) or a "not acknowledge" (UBX-ACK-NAK) message back to the sender, depending on whether or not the message was processed correctly.

Some messages from other classes (e.g. LOG) also use the same acknowledgement mechanism.

5.5.2 Polling Mechanism

All messages that are output by the receiver in a periodic manner (i.e. messages in classes MON, NAV and RXM) and Get/Set type messages, such as the messages in the CFG class, can also be polled.

The UBX protocol is designed so that messages can be polled by sending the message required to the receiver but without a payload (or with just a single parameter that identifies the poll request). The receiver then responds with the same message with the payload populated.

5.6 UBX Class IDs

A class is a grouping of messages which are related to each other. The following table lists all the current message classes.

Name	Class	Description						
NAV	0x01	Navigation Results Messages: Position, Speed, Time, Acceleration, Heading, DOP,						
		SVs used						
RXM	0x02	Receiver Manager Messages: Satellite Status, RTC Status						
INF	0x04	Information Messages: Printf-Style Messages, with IDs such as Error, Warning,						
		Notice						
ACK	0x05	Ack/Nak Messages: Acknowledge or Reject messages to UBX-CFG input messages						
CFG	0x06	Configuration Input Messages: Configure the receiver.						
UPD	0x09	Firmware Update Messages: Memory/Flash erase/write, Reboot, Flash						
	-	identification, etc.						
MON	0x0A	Monitoring Messages: Communication Status, CPU Load, Stack Usage, Task						
		Status						
TIM	0x0D	Timing Messages: Time Pulse Output, Time Mark Results						
MGA	0x13	Multiple GNSS Assistance Messages: Assistance data for various GNSS						
LOG	0x21	Logging Messages: Log creation, deletion, info and retrieval						
SEC	0x27	Security Feature Messages						

All remaining class IDs are reserved.

5.7 UBX Messages Overview

5.9 UBX-CFG (0x06)

Configuration Input Messages: i.e. Configure the receiver..

Messages in the CFG class can be used to configure the receiver and poll current configuration values. Any messages in the CFG class sent to the receiver are either acknowledged (with message UBX-ACK-ACK) if processed successfully or rejected (with message UBX-ACK-NAK) if processing unsuccessfully.

5.9.1 UBX-CFG-ANT (0x06 0x13)

5.9.1.1 Antenna Control Settings

Message		UB	X-CFG-A	TNA							
Description		An	Antenna Control Settings								
Firmware		Su	pported	on:							
		• (ı-blox 9 v	vith p	rotoco	ol versi	on 27.11				
Туре		Ge	t/Set								
Comment		Th	is messa	ige is	depre	cated	in proto	col versions greater	than 23.0	01. Use UBX-

Bitfield flags

This graphic explains the bits of flags

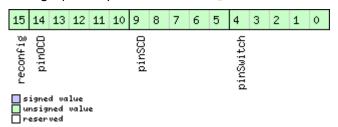

signed	Vα	lue
unsigne	:d	value
reserve	d	

Name	Description
svcs	Enable Antenna Supply Voltage Control Signal
scd	Enable Short Circuit Detection
ocd	Enable Open Circuit Detection
pdwnOnSCD	Power Down Antenna supply if Short Circuit is detected. (only in combination with Bit 1)
recovery	Enable automatic recovery from short state

Bitfield pins

This graphic explains the bits of pins

Name	Description
pinSwitch	PIO-Pin used for switching antenna supply
pinSCD	PIO-Pin used for detecting a short in the antenna supply
pinOCD	PIO-Pin used for detecting open/not connected antenna
reconfig	if set to one, and this command is sent to the receiver, the receiver will reconfigure the pins as
	specified.

5.9.2 UBX-CFG-CFG (0x06 0x09)

5.9.2.1 Clear, Save and Load configurations

Message	UBX-CFG-CFG
Description	Clear, Save and Load configurations
Firmware	Supported on:
	• u-blox 9 with protocol version 27.11
Туре	Command
Comment	This message is deprecated in protocol versions greater than 23.01. Use UBX-
l	CFG-VALSET, UBX-CFG-VALGET, UBX-CFG-VALDEL instead.
	See Receiver Configuration for a detailed description on how Receiver
	Configuration should be used. The behaviour of this message has changed. The
	three masks which were used to clear, save and load a subsection of
	configuration lost their meaning. It is no longer possible to save or clear a
	subsection of the configuration using this message. The behaviour of the masks
	is described as follows:
	• if any bit is set in the clearMask: all configuration in the selected non-volatile

Mask for configuration to save (see

Mask for configuration to load (see

the receiver defaults the operation

Mask which selects the memory devices for saving and/or clearing operation Note that if a deviceMask is not provided,

requested to Battery Backed RAM (BBR) and Flash (if available) (see graphic below)

5.9.5 UBX-CFG-GEOFENCE (0x06 0x69)

5.9.5.1 Geofencing configuration

Message	UBX-CFG-GEOFENCE
Description	Geofencing configuration
Firmware	Supported on:
	• u-blox 9 with protocol version 27.11
Туре	Get/Set
Comment	This message is deprecated in protocol versions greater than 23.01. Use UBX-
	CFG-VALSET, UBX-CFG-VALGET, UBX-CFG-VALDEL instead.
	See the Legacy UBX Message Fields Reference for the corresponding
	configuration item.
	Gets or sets the geofencing configuration
	If the receiver is sent a valid new configuration, it will respond with a UBX-ACK-
	ACK message and immediately change to the new configuration. Otherwise the
	receiver will reject the request, by issuing a UBX-ACK-NAK and continuing
	operation with the previous configuration.
	Note that the acknowledge message does not indicate whether the PIO
	configuration has been successfully applied (pin assigned), it only indicates the
	successful configuration of the feature. The configured PIO must be previously unoccupied for successful assignment.

	Format				
4	X4	-	gnssToFilter	-	Filters out satellites based on their GNSS.
					If a bitfield is enabled, the corresponding
					satellites will be not output. (see graphic
					below)
8	U1	-	svNumbering	-	Configures the display of satellites that do
					not have an NMEA-defined value.
					Note: this does not apply to satellites with
					an unknown ID.
					0: Strict - Satellites are not output
					1: Extended - Use proprietary numbering
					(see Satellite Numbering)
9	U1	-	mainTalkerId	-	By default the main Talker ID (i.e. the
					Talker ID used for all messages other than
					GSV) is determined by the GNSS
					assignment of the receiver's channels (see
					UBX-CFG-GNSS).
					This field enables the main Talker ID to be
					overridden.
					0: Main Talker ID is not overridden
					1: Set main Talker ID to 'GP'
					2: Set main Talker ID to 'GL'
					3: Set main Talker ID to 'GN'
					4: Set main Talker ID to 'GA'
					5: Set main Talker ID to 'GB'
10	U1	-	gsvTalkerId	-	By default the Talker ID for GSV messages
					is GNSS specific (as defined by NMEA).
					This field enables the GSV Talker ID to be
					overridden.
					0: Use GNSS specific Talker ID (as defined
					by NMEA)
					1: Use the main Talker ID
11	U1	-	version	-	Message version (0x01 for this version)
12	CH[2]	-	bdsTalkerId	-	Sets the two characters that should be
					used for the BeiDou Talker ID
					If these are set to zero, the default BeiDou
					TalkerId will be used
14	U1[6]	-	reserved1	-	Reserved

Bitfield filter

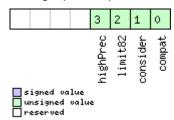

This graphic explains the bits of filter

Name	Description
posFilt	Enable position output for failed or invalid fixes
mskPosFilt	Enable position output for invalid fixes
timeFilt	Enable time output for invalid times
dateFilt	Enable date output for invalid dates
gpsOnlyFilter	Restrict output to GPS satellites only
trackFilt	Enable COG output even if COG is frozen

Bitfield flags

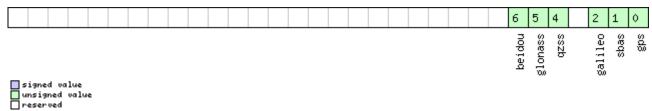

This graphic explains the bits of flags

Name	Description
compat	enable compatibility mode.
	This might be needed for certain applications when customer's NMEA parser expects a fixed number
	of digits in position coordinates
consider	enable considering mode.
limit82	enable strict limit to 82 characters maximum.
highPrec	enable high precision mode.
	This flag cannot be set in conjunction with either Compatibility Mode or Limit82 Mode.

Bitfield gnssToFilter

This graphic explains the bits of gnssToFilter

Name	Description
gps	Disable reporting of GPS satellites
sbas	Disable reporting of SBAS satellites
galileo	Disable reporting of Galileo satellites
qzss	Disable reporting of QZSS satellites
glonass	Disable reporting of GLONASS satellites
beidou	Disable reporting of BeiDou satellites

5.9.15.2 Port configuration for UART ports

Message	UBX-CFG-PRT													
Description	Port configuration for UART ports													
Firmware		Supported on:												
	u-blox 9 with protocol version 27.11													
Туре		Get/Set												
Comment		This message is deprecated in protocol versions greater than 23.01. Use UBX-												
		CFG-VALSET, UBX-CFG-VALGET, UBX-CFG-VALDEL instead.												
		See the Legacy UBX Message Fields Reference for the corresponding configuration item.												
		Several configurations can be concatenated to one input message. In this case												
		the payload length can be a multiple of the normal length (see the other versions												
		of CFG-PRT). Output messages from the module contain only one configuration												
	unit. Note that this message can affect baud rate and other transmission parameters. Because there may be messages queued for transmission there may be uncertainty about which protocol applies to such messages. In addition a													
		message currently in transmission may be corrupted by a protocol change. Host data reception parameters may have to be changed to be able to receive future												
			-	-			-							
			messages, including the acknowledge message resulting from the CFG-PRT message.

Bitfield flags

This graphic explains the bits of flags

									13	12	11	10	9	8	7	6	5	4	3	2	1	0
									syncMode			gridUtcGnss				polarity	alignToTow	isLength	isFreq	lockedOtherSet	lockGnssFreq	active

signed value
unsigned value
reserved

Name	Description
active	If set enable time pulse; if pin assigned to another function, other function takes precedence.
	Must be set for FTS variant.
lockGnssFreq	If set synchronize time pulse to GNSS as soon as GNSS time is valid. If not set, or before GNSS time
	is valid use local clock.
	This flag is ignored by the FTS product variant; in this case the receiver always locks to the best
	available time/frequency reference (which is not necessarily GNSS).
lockedOtherSe	If set the receiver switches between the timepulse settings given by 'freqPeriodLocked' &
t	'pulseLenLocked' and those given by 'freqPeriod' & 'pulseLen'. The 'Locked' settings are used where
	the receiver has an accurate sense of time. For non-FTS products, this occurs when GNSS solution
	with a reliable time is available, but for FTS products the setting syncMode field governs behavior. In
	all cases, the receiver only uses 'freqPeriod' & 'pulseLen' when the flag is unset.
isFreq	If set 'freqPeriodLock' and 'freqPeriod' are interpreted as frequency, otherwise interpreted as period.
isLength	If set 'pulseLenRatioLock' and 'pulseLenRatio' interpreted as pulse length, otherwise interpreted as
	duty cycle.
alignToTow	Align pulse to top of second (period time must be integer fraction of 1s).
	Also set 'lockGnssFreq' to use this feature.
	This flag is ignored by the FTS product variant; it is assumed to be always set (as is lockGnssFreq).
	Set maxSlewRate and maxPhaseCorrRate fields of UBX-CFG-SMGR to 0 to disable alignment.
polarity	Pulse polarity:
	0: falling edge at top of second
	1: rising edge at top of second

Bitfield flags Description continued

Name	Description
gridUtcGnss	Timegrid to use:
	0: UTC
	1: GPS
	2: GLONASS
	3: BeiDou
	4: Galileo
	This flag is only relevant if 'lockGnssFreq' and 'alignToTow' are set.
	Note that configured GNSS time is estimated by the receiver if locked to any GNSS system. If the
	receiver has a valid GNSS fix it will attempt to steer the TP to the specified time grid even if the
	specified time is not based on information from the constellation's satellites. To ensure timing based
	purely on a given GNSS, restrict the supported constellations in UBX-CFG-GNSS.
syncMode	Sync Manager lock mode to use:
	0: switch to 'freqPeriodLock' and 'pulseLenRatioLock' as soon as Sync Manager has an accurate
	time, never switch back to 'freqPeriod' and 'pulseLenRatio'
	1: switch to 'freqPeriodLock' and 'pulseLenRatioLock' as soon as Sync Manager has an accurate
	time, and switch back to 'freqPeriod' and 'pulseLenRatio' as soon as time gets inaccurate
	This field is only relevant for the FTS product variant.
	This field is only relevant if the flag 'lockedOtherSet' is set.

5.9.23 UBX-CFG-VALDEL (0x06 0x8C)

5.9.23.1 Deletes values corresponding to provided keys

Message	UBX-CFG-VALDEL
Description	Deletes values corresponding to provided keys
Firmware	Supported on:
	u-blox 9 with protocol version 27.11
Туре	Set
Comment	Overview:

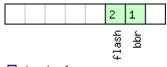

- This message can be used to delete saved configuration to effectively revert them to defaults.
- This message can delete saved configuration from the Flash configuration layer and the BBR configuration layer. The changes won't be effective until these layers are loaded into the RAM layer.
- This message is limited to containing a maximum of 64 keys up for deletion; i. e. N is a maximum of 64.
- This message can be used multiple times and every time the result will be applied immediately. To send this message multiple times with the result being applied at the end, see version 1 of UBX-CFG-VALDEL that supports transactions.
- This message does not check if the resulting configuration is valid.

5.9.25 UBX-CFG-VALSET (0x06 0x8A)

5.9.25.1 Sets values corresponding to provided key-value pairs

Message	UBX-CFG-VALSET
Description	Sets values corresponding to provided key-value pairs
Firmware	Supported on:
	• u-blox 9 with protocol version 27.11
Туре	Set
Comment	Overview:

- This message is used to set a configuration by providing configuration data (a list of key and value pairs), which identify the configuration parameters to change, and their new values.
- This message is limited to containing a maximum of 64 key-value pairs.
- This message can be used multiple times and every time the result will be applied immediately. To send this message multiple times with the result being applied at the end, see version 1 of UBX-CFG-VALSET that supports transactions.

• See Receiver Configuration for details.

This message returns a UBX-ACK-NAK and no configuration is applied:

- if any key is unknown to the receiver FW
- if the layers bitfield does not specify a layer to save a value to
- if the requested configuration is not valid. The validity of a configuration is checked only if the message requests to apply the configuration to the RAM configuration layer.

Notes:

 If a key is sent multiple times within the same message, then the value eventually being applied is the last sent.

5.11.4.2 Log information

Message		UE	UBX-LOG-INFO									
Description		Lo	g inform	ation								
Firmware		Supported on:										
		• (• u-blox 9 with protocol version 27.11									
Туре		Ou	Output									
Comment		 This message is used to report information about the logging subsystem. Note: The reported maximum log size will be smaller than that originally specified LOG-CREATE due to logging and filestore implementation overheads. Log entries are compressed in a variable length fashion, so it may be difficult to predict log space usage with any precision. There may be times when the receiver does not have an accurate time (e.g. the week number is not yet known), in which case some entries will not have timestamp. This may result in the oldest/newest entry time values not take 								y specified in eads. y be difficult e time (e.g. if vill not have a

5.14 UBX-NAV (0x01)

Navigation Results Messages: i.e. Position, Speed, Time, Acceleration, Heading, DOP, SVs used. Messages in the NAV class are used to output navigation data such as position, altitude and velocity in a number of formats. Additionally, status flags and accuracy figures are output. The messages are generated with the configured navigation/measurement rate.

Bitfield svFlag

This graphic explains the bits of ${\tt svFlag}$

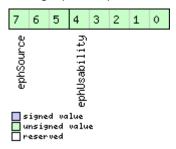

Name	Description
health	SV health:
	0: unknown
	1: healthy
	2: not healty
visibility	SV health:
	0: unknown
	1: below horizon
	2: above horizon
	3: above elevation mask

Bitfield eph

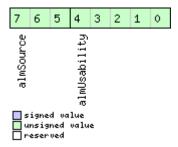

This graphic explains the bits of $\ensuremath{\mathtt{eph}}$

Name	Description					
ephUsability	How long the receiver will be able to use the stored ephemeris data from now on:					
	31: The usability period is unknown					
	30: The usability period is more than 450 minutes					
	30 > n > 0: The usability period is between (n-1)*15 and n*15 minutes					
	0: Ephemeris can no longer be used					
ephSource	0: not available					
	1: GNSS transmission					
	2: external aiding					
	3-7: other					

Bitfield alm

This graphic explains the bits of alm

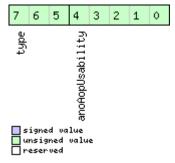

Name	Description					
almUsability	How long the receiver will be able to use the stored almanac data from now on:					
	31: The usability period is unknown					
	30: The usability period is more than 30 days					
	30 > n > 0: The usability period is between n-1 and n days					
	0: Almanac can no longer be used					
almSource	0: not available					
	1: GNSS transmission					
	2: external aiding					
	3-7: other					

Bitfield otherOrb

This graphic explains the bits of ${\tt otherOrb}$

Name	Description					
anoAopUsabili	How long the receiver will be able to use the orbit data from now on:					
ty	31: The usability period is unknown					
	30: The usability period is more than 30 days					
	30 > n > 0: The usability period is between n-1 and n days					
	0: Data can no longer be used					
type	Type of orbit data:					
	0: No orbit data available					
	1: Assist now offline data					
	2: Assist now autonomous data					
	3-7: Other orbit data

Bitfield flags

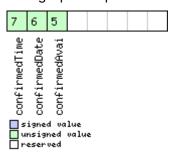

This graphic explains the bits of flags

Name	Description
gpsFixOk	1 = position and velocity valid and within DOP and ACC Masks.
diffSoln	1 = differential corrections were applied
wknSet	1 = Week Number valid (see section Time validity in Integration manual for details)
towSet	1 = Time of Week valid (see section Time validity in Integration manual for details)

Bitfield fixStat

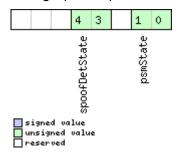

This graphic explains the bits of fixStat

Name	Description
diffCorr	1 = differential corrections available
mapMatching	map matching status:
	00: none
	01: valid but not used, i.e. map matching data was received, but was too old
	10: valid and used, map matching data was applied
	11: valid and used, map matching data was applied. In case of sensor unavailability map matching
	data enables dead reckoning. This requires map matched latitude/longitude or heading data.

Bitfield flags2

This graphic explains the bits of flags2

Name	Description
psmState	power save mode state
	0: ACQUISITION [or when psm disabled]
	1: TRACKING
	2: POWER OPTIMIZED TRACKING
	3: INACTIVE

Bitfield flags2 Description continued

Name	Description
spoofDetState	Spoofing detection state
	0: Unknown or deactivated
	1: No spoofing indicated
	2: Spoofing indicated
	3: Multiple spoofing indications
	Note that the spoofing state value only reflects the dector state for the current navigation epoch. As
	spoofing can be detected most easily at the transition from real signal to spoofing signal, this is also
	where the detector is triggered the most. I.e. a value of 1 - No spoofing indicated does not mean that
	the receiver is not spoofed, it simply states that the detector was not triggered in this epoch.

6 Configuration Interface

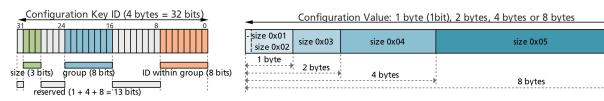

This chapter describes the Receiver Configuration Database accessible through the Configuration Interface.

6.1 Configuration Database

The configuration database in the receiver's RAM holds the current configuration, which is used by the receiver at run-time. It is constructed on startup of the receiver from several sources of configuration. These sources are called Configuration Layers. The current configuration is called the RAM Layer. Any configuration in any layer is organized as Configuration Items, where each Configuration Item is referenced by a unique Configuration Key ID and hold a single Configuration Value.

6.2 Configuration Items

The following figure shows the structure of a Configuration Item, which consists of a (Configuration) Key ID and its (Configuration) Value:

A Configuration Key ID is a 32 bit integer value, which is split into three parts (Note that bits 31, 27. .24 and 15..8 are reserved for future use and are currently unused.):

- bits 30..28: 3 bits that indicate the storage size of a Configuration Value (range 0x01-0x05, see below)
- bits 23..16: 8 bits that define a unique group ID (range 0x01-0xfe)
- bits 7..0: 8 bits that define a unique item ID within a group (range 0x01-0xfe)

The entire 32 bit value is the unique Key ID, which uniquely identifies a particular item. The numeric representation of the Key ID uses the lower-case hexadecimal format, such as 0x20c400a1. An easier, more readable text representation uses the form CFG-GROUP-ITEM. This is also referred to as the (Configuration) Key Name.

Supported storage size identifiers (bits 30..28 of the Key ID) are:

- 0x01: one bit (the actual storage used is one byte, but only the least significant bit is used)
- 0x02: one byte
- 0x03: two bytes
- 0x04: four bytes
- 0x05: eight bytes

Each Configuration Item is of a certain type, which defines the interpretation of the raw binary data (see also number formats):

- U1, U2, U4, U8: unsigned little-endian integers of 8-, 16-, 32- and 64-bit widths
- I1, I2, I4, I8: signed little-endian, two's complement integers of 8-, 16-, 32- and 64-bit widths
- R4, R8: IEEE754 single (32-bit) and double (64-bit) precision floats
- E1, E2, E4: unsigned little-endian enumeration of 8-, 16-, and 32-bit widths (like U1, U2 and U4)

- X1, X2, X4, X8: unsigned little-endian integers of 8-, 16-, 32- and 64-bit widths for bitfields and other binary data, such as strings
- L: single-bit boolean (true = 1, false = 0), stored as U1

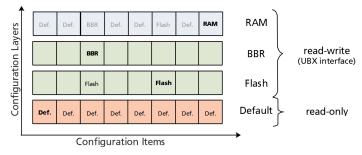

6.3 Configuration Layers

Several Configuration Layers exist. They are separate sources of Configuration Items. Some of the layers are read-only and others are modifiable. Layers are organised in terms of priority. Values in a high priority layer will replace values stored in low priority layer. On startup of the receiver all configuration layers are read and the items within each layer are stacked up in order to create the Current Configuration, which is used by the receiver at run-time.

The following configuration layers are available (in order of priority, highest priority first):

- RAM: This layer contains items stored in volatile RAM. This is the Current Configuration. The value of any item can be set by the user at run-time (see UBX Protocol Interface below) and it will become effective immediately.
- BBR: This layer contains items stored in the battery-backed RAM. The contents in this layer are preserved as long as a battery backup supply is provided during off periods. The value of any item can be set by the user at run-time (see UBX Protocol Interface below) and it will become effective upon a restart of the receiver.
- Flash: This layer contains items stored permanently in the external flash memory. This layer is only available if there is a usable external flash memory. The value of any item can be set by the user at run-time (see UBX Protocol Interface below) it will become effective upon a restart of the receiver.
- **Default:** This layer contains all items known to the running receiver software and their hard-coded default values. Data in this layer is not writable.

The stacking of the Configuration Items from the different layers (sources) in order to construct the Current Configuration in the RAM Layer is depicted in the following figure. For each defined item, i.e. for each item in the Default Layer, the receiver software goes through the layers above and stacks all the found items on top. Some items may not be present in every layer. The result is the RAM Layer filled with all Configuration Items given Configuration Values coming from the highest priority layer the corresponding item was present. In the example figure below bold text indicates the source of the value in the Current Configuration (the RAM Layer). Empty boxes indicate that the layer can hold the item but that it is not currently stored there. Boxes with text indicate that an item is currently stored in the layer.

In the example figure above several items (e.g. the first item) are only set in the Default Layer and hence the default value ends up in Current Configuration in the RAM Layer. The third item is present in the Default, Flash and BBR Layers. The value from the BBR Layer has the highest priority and therefore it ends up in the RAM Layer. On the other hand, the default value of the

sixth item is changed by the value in the Flash Layer. The value of the last item is changed in the RAM Layer only, i.e. upon startup the value in the RAM Layer was the value from the Default Layer, but the user has changed the value in the RAM Layer at run-time.

6.4 Configuration Interface Access

The following sections describe the existing interfaces to access the Configuration Database.

6.4.1 UBX Protocol Interface

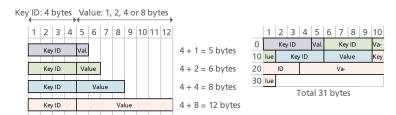

The following UBX protocol messages are available to access the Configuration Database:

- UBX-CFG-VALGET to read Configuration Items from the database
- UBX-CFG-VALSET to set Configuration Items in the database
- UBX-CFG-VALDEL to delete Configuration Items from the database

6.5 Configuration Data

Configuration data is the binary representation of a list of Key ID and Value pairs. It is formed by concatenating keys (U4 values) and values (variable type) without any padding. This format is used in the UBX-CFG-VALSET and UBX-CFG-VALGET messages.

The figure below shows an example. The four Items (Key ID - Value pairs) on the left use the four fundamental storage sizes: one byte (L, U1, I1, E1 and X1 types), 2 bytes (U2, I2, E2 and X2 types), four bytes (U4, I4, E4, X4 and R4 types) and eight bytes (U8, I8, X8 and R8 types). When concatenated (right) the Key IDs and Values are not aligned and there is no padding.

Note that this is an arbitrary example and any number of items of any value storage size can be concatenated the same way.

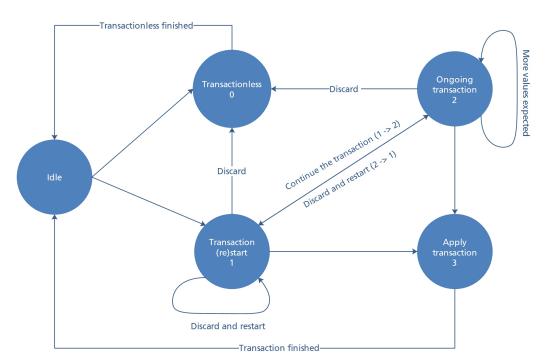

6.6 Configuration Transactions

The configuration concept supports two mechanisms of configuration, a transactionless mechanism where sent configuration changes are applied immediately to the configuration layer(s) requested. The second mechanism is a configuration transaction.

A transaction offers a way of queuing multiple configuration changes. It is particularly useful where different configuration keys depend on each other in such a way that sending one before the other can cause the configuration to be rejected. The queued configuration change requests are stored then checked collectively before being applied to the receiver.

A transaction can have the following states described in the figure below.

When starting a transaction, the user must specify the layer(s) the changes will be applied to. This list of configuration layer(s) must be observed throughout the transaction states, modifying the configuration layer(s) mid-transaction will cause the transaction to be aborted and no queued changes will be applied.

In the start transaction state, the receiver will lock the configuration database so that changes from another entity or message cannot be applied. It is possible to send a configuration key-value pairs with the start transaction state, and that will be queued waiting to be applied.

In the ongoing state, a configuration key and value must be sent, the receiver will abort the transaction and not apply any changes if this condition is violated, key-value pairs sent in the ongoing state will be queued waiting to be applied.

In the apply state, the queued changes will be collectively checked and applied to the requested configuration layer(s). Note that any additional key-value pairs sent within the apply state will be ignored.

Note that a transaction can only come from a single source, a UBX-CFG-VALSET message or a UBX-CFG-VALDEL message. This means that in any given transaction it is not possible to mix a delete and a save request, starting a transaction from a different source will abort the current transaction and no queued changes would be applied.

Please refer to UBX-CFG-VALSET and UBX-CFG-VALDEL messages for a detailed description of how to setup a configuration transaction, its limitations and conditions that would cause the transaction to be rejected.

6.7 Reset Behaviour

The RAM layer is always rebuilt from the layers below when the chip's processor comes out from reset. When using UBX-CFG-RST the processor goes through a reset cycle with these reset types (resetMode field):

- 0x00 hardware reset (watchdog) immediately
- 0x01 controlled software reset

0x04 hardware reset (watchdog) after shutdown

6.8 Configuration Reference

See Configuration Defaults for the default values.

6.8.1 CFG-GEOFENCE: Geofencing Configuration

See the chapter Geofencing in Integration manual for feature details.

If the receiver is sent a valid new configuration, it will respond with a UBX-ACK-ACK message and immediately change to the new configuration. Otherwise the receiver will reject the request, by issuing a UBX-ACK-NAK and continuing operation with the previous configuration.

Note that the acknowledge message does not indicate whether the PIO configuration has been successfully applied (pin assigned), it only indicates the successful configuration of the feature. The configured PIO must be previously unoccupied for successful assignment.

6.8.8 CFG-LOGFILTER: Data Logger Configuration

This group can be used to configure the data logger, i.e. to enable/disable the log recording and to get/set the position entry filter settings.

Position entries can be filtered based on time difference, position difference or current speed thresholds. Position and speed filtering also have a minimum time interval. A position is logged if any of the thresholds are exceeded. If a threshold is set to zero it is ignored. The maximum rate of position logging is 1Hz.

The filter settings will be configured to the provided values only if the 'applyAllFilterSettings' flag is set. This allows the recording to be enabled/disabled independently of configuring the filter settings.

It is possible to configure the data logger in the absence of a logging file. By doing so, once the logging file is created, the data logger configuration will take effect immediately and logging recording and filtering will activate according to the configuration.

If the 3D position difference is greater than the threshold then the position is logged (0 = not set).						
MIN_INTERVAL also applies.						
Note: the value set here does not take effect unless CFG-LOGFILTER-APPLY_ALL_FILTERS is						
enabled						

6.8.9 CFG-MOT: Motion Detector Configuration

The items in this group specify the parameters used for the internal receiver motion detector. The platform motion is assessed by combining the detected motion of different detectors looking at specific data types (i.e. GNSS, gyroscopes, accelerometers, wheel-ticks). The decision thresholds of the internal detectors can be specified using the configuration items in this group.

Constants for CFG-NMEA-SVNUMBERING

Constant	Value	Description
STRICT	0	Strict - satellites are not output
EXTENDED	1	Extended - use proprietary numbering

Constants for CFG-NMEA-MAINTALKERID

Constant	Value	Description
AUTO	0	Main Talker ID is not overridden
GP	1	Set main Talker ID to 'GP'
GL	2	Set main Talker ID to 'GL'
GN	3	Set main Talker ID to 'GN'
GA	4	Set main Talker ID to 'GA' (not available in all products)
GB	5	Set main Talker ID to 'GB' (not available in all products)

Constants for CFG-NMEA-GSVTALKERID

Constant	Value	Description
GNSS	0	Use GNSS specific Talker ID (as defined by NMEA)
MAIN	1	Use the main Talker ID

6.8.14 CFG-ODO: Odometer and Low-Speed Course Over Ground Filter Configuration

The items in this group allow the user to configure the Odometer feature and Low-Speed Course Over Ground Filter.

CFG-ODO-* Configuration Items

				1	1
Configuration Item	Key ID	Тур	Scale	Unit	Description
		е			
CFG-ODO-USE_ODO	0x10220001	L	-	-	Use odometer
CFG-ODO-USE_COG	0x10220002	L	-	-	Use low-speed course over
					ground filter
CFG-ODO-OUTLPVEL	0x10220003	L	-	-	Output low-pass filtered velocity
CFG-ODO-OUTLPCOG	0x10220004	L	-	-	Output low-pass filtered course
					over ground (heading)
CFG-ODO-PROFILE	0x20220005	E1	-	-	Odometer profile configuration
See Constants for CFG-ODO-PI	ROFILE below t	or a	list of p	ossible	constants for this item.
CFG-ODO-COGMAXSPEED	0x20220021	U1	-	m/s	Upper speed limit for low-speed
					course over ground filter
CFG-ODO-COGMAXPOSACC	0x20220022	U1	-	-	Maximum acceptable position
					accuracy for computing low-
					speed filtered course over ground
CFG-ODO-VELLPGAIN	0x20220031	U1	-	-	Velocity low-pass filter level
Range is from 0 to 255.					
CFG-ODO-COGLPGAIN	0x20220032	U1	-	-	Course over ground low-pass
					filter level (at speed < 8 m/s)
Range is from 0 to 255.					

Constants for CFG-ODO-PROFILE

Constant	Value	Description
RUN	0	Running
CYCL	1	Cycling
SWIM	2	Swimming
CAR	3	Car
CUSTOM	4	Custom

6.8.15 CFG-RATE: Navigation and Measurement Rate Configuration

The configuration items in this group allow the user to alter the rate at which navigation solutions (and the measurements that they depend on) are generated by the receiver. The calculation of the navigation solution will always be aligned to the top of a second zero (first second of the week) of the configured reference time system. The navigation period is an integer multiple of the measurement period.

CFG-RATE-* Configuration Items

Configuration Item	Key ID	Тур	Scale	Unit	Description		
		е					
CFG-RATE-MEAS	0x30210001	U2	0.001	s	Nominal time between GNSS		
					measurements		
E.g. 100ms results in 10Hz mea	E.g. 100ms results in 10Hz measurement rate, 1000ms = 1Hz measurement rate.						
CFG-RATE-NAV	0x30210002	U2	-	-	Ratio of number of		
					measurements to number of		
					navigation solutions		
E.g. 5 means five measurements for every navigation solution. The maximum value is 127.							

CFG-RATE-* Configuration Items continued

Configuration Item	Key ID	Тур	Scale	Unit	Description
		е			
CFG-RATE-TIMEREF	0x20210003	E1	-	-	Time system to which
					measurements are aligned
See Constants for CFG-RATE-TIMEREF below for a list of possible constants for this item.					

Constants for CFG-RATE-TIMEREF

Constant	Value	Description
UTC	0	Align measurements to UTC time
GPS	1	Align measurements to GPS time
GLO	2	Align measurements to GLONASS time
BDS	3	Align measurements to BeiDou time
GAL	4	Align measurements to Galileo time

6.8.16 CFG-RINV: Remote Inventory

The Remote Inventory enables storing user-defined data in the non-volatile memory of the receiver. The data can be either binary or a string of ASCII characters. In the latter case, it can optionally be output at startup after the boot screen.

CFG-RINV-* Configuration Items

Configuration Item	Key ID	Тур	Scale	Unit	Description			
Configuration rein	Rey ID	1	Scale	Offic	Description			
		е						
CFG-RINV-DUMP	0x10c70001	L	-	-	Dump data at startup			
When true, data will be dumped	When true, data will be dumped to the interface on startup, unless CFG-RINV-BINARY is set.							
CFG-RINV-BINARY	0x10c70002	L	-	-	Data is binary			
When true, the data is treated a	as binary data.			-				
CFG-RINV-DATA_SIZE	0x20c70003	U1	-	-	Size of data			
Size of data to store/be stored in the Remote Inventory (maximum 30 bytes).								
CFG-RINV-CHUNKO	0x50c70004	X8	-	-	Data bytes 1-8 (LSB)			
Data to store/be stored in Remo	ote Inventory -	max	8 byte	s, left-r	nost in LSB, e.g. string ABCD will			
appear as 0x44434241.								
CFG-RINV-CHUNK1	0x50c70005	X8	-	-	Data bytes 9-16			
Data to store/be stored in Remo	ote Inventory -	max	8 byte	s, left-r	most in LSB, e.g. string ABCD will			
appear as 0x44434241.								
CFG-RINV-CHUNK2	0x50c70006	X8	-	-	Data bytes 17-24			
Data to store/be stored in Remote Inventory - max 8 bytes, left-most in LSB, e.g. string ABCD will								
appear as 0x44434241.								
CFG-RINV-CHUNK3	0x50c70007	X8	-	-	Data bytes 25-30 (MSB)			
Data to store/be stored in Remote Inventory - max 6 bytes, left-most in LSB, e.g. string ABCD will								
appear as 0x44434241.								

6.8.17 CFG-SIGNAL: Satellite Systems (GNSS) Signal Configuration

It is necessary for at least one signal and constellation from a major GNSS to be enabled, after applying the new configuration to the current one.

The individual signals enable keys are governed by their corresponding constellation enable key. See GNSS Signal Configuration for more details.

Configuration specific to a GNSS system can be done via other groups (e.g. **CFG-SBAS-***). Note that changes to any items within this group will trigger a reset to the GNSS subsystem.

CFG-SIGNAL-* Configuration Items

Configuration Item	Key ID	Тур	Scale	Unit	Description
		е			
CFG-SIGNAL-GPS_ENA	0x1031001f	L	-	-	GPS enable
CFG-SIGNAL-GPS_L1CA_ENA	0x10310001	L	-	-	GPS L1C/A

6.8.18 CFG-SPI: Configuration of the SPI Interface

Settings needed to configure the SPI communication interface.

CFG-SPI-* Configuration Items

Configuration Item	Key ID	Тур	Scale	Unit	Description
		е			
CFG-SPI-MAXFF	0x20640001	U1	-	-	Number of bytes containing 0xFF to receive before switching off reception. Range: 0(mechanism off)-63
CFG-SPI-CPOLARITY	0x10640002	L	-	-	Clock polarity select: 0: Active Hight Clock, SCLK idles low, 1: Active Low Clock, SCLK idles high
CFG-SPI-CPHASE	0x10640003	L	-	-	Clock phase select: 0: Data captured on first edge of SCLK, 1: Data captured on second edge of SCLK
CFG-SPI-EXTENDEDTIMEOUT	0x10640005	L	-	-	Flag to disable timeouting the interface after 1.5s

CFG-SPI-* Configuration Items continued

Configuration Item	Key ID	Тур	Scale	Unit	Description
		е			
CFG-SPI-ENABLED	0x10640006	L	-	-	Flag to indicate if the SPI
					interface should be enabled

6.8.19 CFG-SPIINPROT: Input Protocol Configuration of the SPI Interface

Input protocol enable flags of the SPI interface.

CFG-SPIINPROT-* Configuration Items

Configuration Item	Key ID	Тур	Scale	Unit	Description
		е			
CFG-SPIINPROT-UBX	0x10790001	L	-	-	Flag to indicate if UBX should be
		Ī			an input protocol on SPI
CFG-SPIINPROT-NMEA	0x10790002	L	-	-	Flag to indicate if NMEA should
		Ī			be an input protocol on SPI
CFG-SPIINPROT-RTCM3X	0x10790004	L	-	-	Flag to indicate if RTCM3X
		Ī			should be an input protocol on
					SPI

6.8.20 CFG-SPIOUTPROT: Output Protocol Configuration of the SPI Interface

Output protocol enable flags of the SPI interface.

CFG-SPIOUTPROT-* Configuration Items

Configuration Item	Key ID	Тур	Scale	Unit	Description
		е			
CFG-SPIOUTPROT-UBX	0x107a0001	L	-	-	Flag to indicate if UBX should be
					an output protocol on SPI
CFG-SPIOUTPROT-NMEA	0x107a0002	L	-	-	Flag to indicate if NMEA should
					be an output protocol on SPI
CFG-SPIOUTPROT-RTCM3X	0x107a0004	L	-	-	Flag to indicate if RTCM3X
					should be an output protocol on
					SPI

6.8.21 CFG-TMODE: Time Mode Configuration

Configuration for operation of the receiver in Time Mode. The position referred to in the configuration items is that of the Antenna Reference Point (ARP).

CFG-TMODE-* Configuration Items

Configuration Item	Key ID	Тур	Scale	Unit	Description	
		е				
CFG-TMODE-MODE	0x20030001	E1	-	-	Receiver mode	
See Constants for CFG-TMODE-MODE below for a list of possible constants for this item.						
CFG-TMODE-POS_TYPE	0x20030002	E1	-	-	Determines whether the ARP	
					position is given in ECEF or	
					LAT/LON/HEIGHT?	
See Constants for CFG-TMODE-POS_TYPE below for a list of possible constants for this item.						

CFG-TMODE-* Configuration Items con	tinued				
Configuration Item	Key ID	Тур	Scale	Unit	Description
		е			
CFG-TMODE-ECEF_X	0x40030003	14	-	cm	ECEF X coordinate of the ARP
					position.
This will only be used if CFG-TN	/ODE-MODE=F	IXE	and C	FG-TM	IODE-POS_TYPE=ECEF.
CFG-TMODE-ECEF_Y	0x40030004	14	-	cm	ECEF Y coordinate of the ARP
					position.
This will only be used if CFG-TN	/ODE-MODE=F	IXEC	and C	FG-TM	IODE-POS_TYPE=ECEF.
CFG-TMODE-ECEF_Z	0x40030005	14	-	cm	ECEF Z coordinate of the ARP
					position.
This will only be used if CFG-TN	/ODE-MODE=F	IXE	and C	FG-TM	1.
CFG-TMODE-ECEF_X_HP	0x20030006	I1	0.1	mm	High-precision ECEF X coordinate
					of the ARP position.
Accepted range is -99 to +99.					la a a la la la la la la la la la la la
This will only be used if CFG-TN	/ODF-MODE=F	EIXF	and C	FG-TM	IODE-POS TYPE=ECEE

CFG-UART1-PARITY	0x20520004	E1	-	-	Parity mode that should be used	
					on UART1	
See Constants for CFG-UART1-	See Constants for CFG-UART1-PARITY below for a list of possible constants for this item.					
CFG-UART1-ENABLED	0x10520005	L	-	-	Flag to indicate if the UART1	
					should be enabled	

Constants for CFG-UART1-STOPBITS

Constant	Value	Description
HALF	0	0.5 stopbits
ONE	1	1.0 stopbits
ONEHALF	2	1.5 stopbits
TWO	3	2.0 stopbits

Constants for CFG-UART1-DATABITS

Constant	Value	Description
EIGHT	0	8 databits
SEVEN	1	7 databits

Constants for CFG-UART1-PARITY

Constant	Value	Description
NONE	0	No parity bit
ODD	1	Add an odd parity bit
EVEN	2	Add an even parity bit

6.8.25 CFG-UART1INPROT: Input Protocol Configuration of the UART1 Interface

Input protocol enable flags of the UART1 interface.

CFG-UART1INPROT-* Configuration Items

Configuration Item	Key ID	Тур	Scale	Unit	Description
		е			
CFG-UART1INPROT-UBX	0x10730001	L	-	-	Flag to indicate if UBX should be
					an input protocol on UART1
CFG-UART1INPROT-NMEA	0x10730002	L	-	-	Flag to indicate if NMEA should
					be an input protocol on UART1
CFG-UART1INPROT-RTCM3X	0x10730004	L	-	-	Flag to indicate if RTCM3X
					should be an input protocol on
					UART1

6.8.26 CFG-UART10UTPROT: Output Protocol Configuration of the UART1 Interface

Output protocol enable flags of the UART1 interface.

CFG-UART1OUTPROT-* Configuration Items

Configuration Item	Key ID	Тур	Scale	Unit	Description
		е			
CFG-UART1OUTPROT-UBX	0x10740001	L	-	-	Flag to indicate if UBX should be
					an output protocol on UART1
CFG-UART1OUTPROT-NMEA	0x10740002	L	-	-	Flag to indicate if NMEA should
					be an output protocol on UART1
CFG-UART10UTPROT-	0x10740004	L	-	-	Flag to indicate if RTCM3X
RTCM3X					should be an output protocol on
					UART1

6.8.27 CFG-UART2: Configuration of the UART2 Interface

Settings needed to configure the UART2 communication interface.

CFG-UART2-* Configuration Items

Configuration Item	Key ID	Тур	Scale	Unit	Description		
		е					
CFG-UART2-BAUDRATE	0x40530001	U4	-	-	The baud rate that should be		
					configured on the UART2		
CFG-UART2-STOPBITS	0x20530002	E1	-	-	Number of stopbits that should		
					be used on UART2		
See Constants for CFG-UAR	T2-STOPBITS be	low f	or a list	of pos	sible constants for this item.		
CFG-UART2-DATABITS	0x20530003	E1	-	-	Number of databits that should		
					be used on UART2		
See Constants for CFG-UAR	T2-DATABITS be	low f	or a list	of pos	sible constants for this item.		
CFG-UART2-PARITY	0x20530004	E1	-	-	Parity mode that should be used		
					on UART2		
See Constants for CFG-UAR	See Constants for CFG-UART2-PARITY below for a list of possible constants for this item.						
CFG-UART2-ENABLED	0x10530005	L	-	-	Flag to indicate if the UART2		
					should be enabled		
CFG-UART2-REMAP	0x10530006	L	-	-	UART2 Remapping		

Constants for CFG-UART2-STOPBITS

Constant	Value	Description
HALF	0	0.5 stopbits
ONE	1	1.0 stopbits
ONEHALF	2	1.5 stopbits
TWO	3	2.0 stopbits

Constants for CFG-UART2-DATABITS

Constant	Value	Description
EIGHT	0	8 databits
SEVEN	1	7 databits

Constants for CFG-UART2-PARITY

Constant	Value	Description
NONE	0	No parity bit
ODD	1	Add an odd parity bit
EVEN	2	Add an even parity bit

6.8.28 CFG-UART2INPROT: Input Protocol Configuration of the UART2 Interface

Input protocol enable flags of the UART2 interface.

CFG-UART2INPROT-* Configuration Items

Configuration Item	Key ID	Тур	Scale	Unit	Description
		е			
CFG-UART2INPROT-UBX	0x10750001	L	-	-	Flag to indicate if UBX should be
		Ĭ			an input protocol on UART2
CFG-UART2INPROT-NMEA	0x10750002	L	-	-	Flag to indicate if NMEA should
		Ī			be an input protocol on UART2
CFG-UART2INPROT-RTCM3X	0x10750004	L	-	-	Flag to indicate if RTCM3X
		Ī			should be an input protocol on
					UART2

6.8.29 CFG-UART2OUTPROT: Output Protocol Configuration of the UART2 Interface

Output protocol enable flags of the UART2 interface.

CFG-UART2OUTPROT-* Configuration Items

Configuration Item	Key ID	Тур	Scale	Unit	Description
		е			
CFG-UART2OUTPROT-UBX	0x10760001	L	-	-	Flag to indicate if UBX should be
					an output protocol on UART2
CFG-UART2OUTPROT-NMEA	0x10760002	L	-	-	Flag to indicate if NMEA should
					be an output protocol on UART2
CFG-UART2OUTPROT-	0x10760004	L	-	-	Flag to indicate if RTCM3X
RTCM3X					should be an output protocol on
					UART2

6.8.30 CFG-USB: Configuration of the USB Interface

Settings needed to configure the USB communication interface.

CFG-USB-* Configuration Items

Configuration Item	Key ID	Тур	Scale	Unit	Description
		е			
CFG-USB-ENABLED	0x10650001	L	-	-	Flag to indicate if the USB
					interface should be enabled

7 RTCM Protocol

7.1 RTCM version 3

7.1.1 Supported Messages

The following RTCM 3.3 input messages are supported:

Supported RTCM 3.3 Input Messages

Message Type	Description
1001	L1-only GPS RTK observations
1002	Extended L1-only GPS RTK observations
1003	L1/L2 GPS RTK observations
1004	Extended L1/L2 GPS RTK observations
1005	Stationary RTK reference station ARP
1006	Stationary RTK reference station ARP with antenna height
1007	Antenna descriptor
1009	L1-only GLONASS RTK observations
1010	Extended L1-only GLONASS RTK observations
1011	L1/L2 GLONASS RTK observations
1012	Extended L1/L2 GLONASS RTK observations
1033	Receiver and antenna descriptors
1074	GPS MSM4
1075	GPS MSM5
1077	GPS MSM7
1084	GLONASS MSM4
1085	GLONASS MSM5
1087	GLONASS MSM7
1094	Galileo MSM4
1095	Galileo MSM5
1097	Galileo MSM7
1124	BeiDou MSM4
1125	BeiDou MSM5
1127	BeiDou MSM7
1230	GLONASS code-phase biases
4072, sub-type	Reference station PVT (u-blox proprietary RTCM Message)
0	
4072, sub-type 1	Additional reference station information (u-blox proprietary RTCM Message)

The following RTCM 3.3 output messages are supported:

RTCM output messages are configured using the configuration items CFG-MSGOUT-RTCM*.

Supported RTCM 3.3 Output Messages

Message Type	Cls/ID	Description
1005	0xF5 0x05	Stationary RTK reference station ARP
1074	0xF5 0x4A	GPS MSM4
1077	0xF5 0x4D	GPS MSM7
1084	0xF5 0x54	GLONASS MSM4
1087	0xF5 0x57	GLONASS MSM7

Supported RTCM 3.3 Output Messages continued

Message Type	Cls/ID	Description
1094	0xF5 0x5E	Galileo MSM4
1097	0xF5 0x61	Galileo MSM7
1124	0xF5 0x7C	BeiDou MSM4
1127	0xF5 0x7F	BeiDou MSM7
1230	0xF5 0xE6	GLONASS code-phase biases
4072, sub-type	0xF5 0xFE	Reference station PVT (u-blox proprietary RTCM Message)
0		
4072, sub-type 1	0xF5 0xFD	Additional reference station information (u-blox proprietary
		RTCM Message)

7.1.2 u-blox Proprietary RTCM Messages

The RTCM message type 4072 is the u-blox proprietary RTCM message. It is supported by the RTCM standard version 3.2 and above.

7.1.2.1 Sub-Types

There are different available sub-types of the RTCM message type 4072. The table below shows the available RTCM 4072 sub-types.

RTCM 4072 Sub-Types

Sub-	Message Type	Sub-Type	Description	Message Data (Payload) Length (bits)
Туре	Number	Number		
0	0xFE8	0x000	Reference station PVT	1008+48
1	0xFE8	0x001	Additional reference	112+48*(2*N)
			station information	(N = the number of enabled GNSS
				constellations)

7.1.3 Configuration

The configuration of the RTK rover and reference station is explained in the Integration Manual.

The RTCM3 protocol can be disabled/enabled on communication interfaces by means of the configuration items, for example CFG-UART1OUTPROT-RTCM3X.

7.1.4 Reference

The RTCM3 support is implemented according to RTCM STANDARD 10403.3 DIFFERENTIAL GNSS (GLOBAL NAVIGATION SATELLITE SYSTEMS) SERVICES - VERSION 3.

Appendix

A Satellite Numbering

A summary of all the SV numbering schemes is provided in the following table.

Satellite numbering

GNSS Type	SV range	UBX gnssld:	UBX svld	NMEA 2.X-	NMEA 2.X-4.0	NMEA 4.10+	NMEA 4.10+
		svld		4.0 (strict)	(extended)	(strict)	(extended)
GPS	G1-G32	0:1-32	1-32	1-32	1-32	1-32	1-32
SBAS	S120-	1:120-158	120-158	33-64	33-64,152-	33-64	33-64,152-
	S158				158		158
Galileo	E1-E36	2:1-36	211-246	-	301-336	1-36	1-36
BeiDou	B1-B37	3:1-37	159-163,33-	-	401-437	1-37	1-37
			64				
QZSS	Q1-Q10	5:1-10	193-202	-	193-202	-	193-202
GLONAS	R1-R32,	6:1-32, 6:	65-96, 255	65-96,	65-96, null	65-96,	65-96, null
S	R?	255		null		null	

B UBX and NMEA Signal Identifiers

UBX and NMEA protocols use signal identifiers (commonly abbreviated to "sigld") to distinguish between different signals from GNSS.

Signal identifiers are only valid when combined with a GNSS identifier (see above). The table below shows the range of identifiers currently supported in the firmware.

The following table shows the mapping of GNSS signals to UBX / NMEA signal identifier.

Signal Identifiers

Signal name	UBX gnssld	UBX sigld	NMEA 4.10+ gnssld	NMEA 4.10+ sigld
GPS L1C/A*	0	0	1	1
GPS L2 CL	0	3	1	6
GPS L2 CM	0	4	1	5
Galileo E1 C*	2	0	3	7
Galileo E1 B*	2	1	3	7
Galileo E5 bl	2	5	3	2
Galileo E5 bQ	2	6	3	2
BeiDou B1I D1*	3	0	4**	1**
BeiDou B1I D2*	3	1	4**	1**
BeiDou B2I D1	3	2	4**	3**
BeiDou B2I D2	3	3	4**	3**
QZSS L1C/A*	5	0		
QZSS L2 CM	5	4		
QZSS L2 CL	5	5		
GLONASS L1 OF*	6	0	2	1
GLONASS L2 OF	6	2	2	3

UBX messages, that don't have an explicit sigld field, contain information about the subset of signals marked with (*).

BeiDou gnssld and sigld are not defined in the NMEA protocol version 4.10, values shown in the table are valid for u-blox products only (**).

C Configuration Defaults

The configuration defaults given in this section apply to the receiver firmwares given below.

C.1 u-blox 9 ZED-F9P (version 1.00 HPG 1.12)

This section lists the configuration defaults for the u-blox 9 ZED-F9P (version 1.00 HPG 1.12), protocol version 27.11.

Overview

As part of our commitment to customer support, u-blox maintains an extensive volume of technical documentation for our products. In addition to product-specific data sheets and integration manuals, general documents are also available. These include:

- GPS Compendium, Docu. No GPS-X-02007
- GPS Antennas RF Design Considerations for u-blox GPS Receivers, Docu. No GPS-X-08014 Our website www.u-blox.com is a valuable resource for general and product specific documentation.

Related Documents for ZED-F9P

- u-blox ZED-F9P, Data Sheet, Docu. No UBX-17051259
- u-blox ZED-F9P, Integration Manual, Docu. No UBX-18010802
